Figure S1: (A) Negative controls of histological section from human ganglioneuroma (left, secondary mouse antibody) and undifferentiated neuroblastoma (right, secondary rabbit antibody) by immunohistochemistry (50 μm bar indicated). (B) GRP (100 nM) treatment in bottom wells of transwell plate induced BE(2)-C cell migration. Values are expressed by counting DAPI staining of migrated cell numbers (200× magnification) (*= p <0.05 vs. CON).
