Received 8 May 2013; accepted 21 May 2013

 Key indicators: single-crystal X-ray study; $T = 90$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.034; wR factor = 0.081; data-to-parameter ratio = 19.8.

 In the title molecule, $\text{C}_{16}\text{H}_{14}\text{Cl}_4\text{O}$, the dihedral angle between the least-square planes of the benzene rings is 84.40 (7°). No unusual intermolecular interactions are present.

2,2',5',6-Tetrachloro-4-[(1S)-1-methylpropoxy]biphenyl**Hans-Joachim Lehmler, Huimin Wu and Sean Parkin****Comment**

The title compound was synthesized as an intermediate in ongoing efforts to synthesize atropisomerically pure hydroxylated polychlorinated biphenyls (PCBs) for metabolism and toxicological studies (Lehmler *et al.*, 2010; Warner *et al.*, 2009). The dihedral angle between the two phenyl rings of the title compound, an important determinant of the toxicity of PCBs, was 84.40 (7)°. Comparable solid state dihedral (82–83°) have been reported for structurally related PCB derivatives with three *ortho* chlorine substituents (Lehmler *et al.*, 2005; Rissanen *et al.*, 1988*b*). Slightly larger (84–87°) dihedral angles have been observed for PCB derivatives with four *ortho* chlorine substituents (Pedersen, 1975; Singh & McKinney, 1979). Smaller solid state dihedral angles have been reported for PCB derivatives with zero, one or two *ortho* chlorine substituents due to the smaller steric demand of multiple hydrogen substituents in *ortho* position (Mannila & Rissanen, 1994; Miao *et al.*, 1996; Rissanen *et al.*, 1988*a*; Shaikh *et al.*, 2008; Singh *et al.*, 1986; van der Sluis *et al.*, 1990; Vyas *et al.*, 2006).

Experimental

The title compound was synthesized by the Mitsunobu reaction of 2,2',5',6-tetrachloro-biphenyl-4-ol with (*R*)-isobutanol in THF (Fujita *et al.*, 2001). Crystals suitable for crystal structure analysis were obtained by slowly evaporating a methanolic solution of the title compound.

Refinement

H atoms were found in difference Fourier maps and subsequently placed in idealized positions with constrained distances of 0.98 Å (RCH₃), 0.99 Å (R₂CH₂), 1.00 Å (R₃CH), 0.95 Å (C_{sp2}H), and with $U_{\text{iso}}(\text{H})$ values set to either 1.2 U_{eq} or 1.5 U_{eq} (RCH₃) of the attached atom. The absolute configuration was determined from 1625 Friedel pairs [Flack ' x ' = 0.00 (6)].

Computing details

Data collection: *COLLECT* (Nonius, 1998); cell refinement: *SCALEPACK* (Otwinowski & Minor, 1997); data reduction: *DENZO-SMN* (Otwinowski & Minor, 1997); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *XP* in *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *SHELXL97* (Sheldrick, 2008) and local procedures.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against all reflections. The weighted R -value wR and goodness of fit S are based on F^2 . Conventional R -values R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -values based on F^2 are statistically about twice as large as those based on F , and R -values based on ALL data will be even larger.
