Public Health Delivery Systems and Population Health

Glen Mays, PhD, MPH
University of Kentucky

glen.mays@uky.edu
Issues to examine today

- What are public health activities and what roles do they play in the larger U.S. health system?
- How and how well are they delivered in the U.S.?
- What are the health and economic effects attributable to public health delivery?
- What strategies may work to improve public health delivery?
Fundamental health system performance
Preventable mortality in the U.S. & peers

U.S. Men and Women Under Age 65 Have Higher Rates of Potentially Preventable Deaths
Slowest Rate of Improvement, 1999–2007

Amenable mortality, men ages 0–64
Age-standardized death rate/100,000

1999 2007
FRA GER* UK US

Amenable mortality, women ages 0–64
Age-standardized death rate/100,000

1999 2007
FRA GER* UK US

* Data for Germany are 1999 and 2006.
Geographic variation in population health

Source: Commonwealth Fund 2012
Preventable disease burden and national health spending

>75% of national health spending is attributable to conditions that are largely preventable

- Cardiovascular disease
- Diabetes
- Lung diseases
- Cancer
- Injuries
- Vaccine-preventable diseases and sexually transmitted infections

<5% of national health spending is allocated to public health and prevention

CDC 2008 and CMS 2011
Public health activities

Organized programs, policies, and laws to prevent disease and injury and promote health on a population-wide basis

- Epidemiologic surveillance & investigation
- Community health assessment & planning
- Communicable disease control
- Chronic disease and injury prevention interventions
- Health education and communication
- Environmental health monitoring and assessment
- Enforcement of health laws and regulations
- Inspection and licensing: food, facilities, services
- Inform, advise, and assist school-based, worksite-based, and community-based health programming

...and roles in assuring access to medical care
Factors driving growth in medical spending per case

Roehrig et al. Health Affairs 2011
Public health spending in the U.S.

Governmental Expenditures for Public Health Activity, USDHHS National Health Expenditure Accounts

- Percent of NHE (x100)
- Percent of GDP (x1000)
- Per capita ($100s nominal)
- Per capita ($100s constant)

U.S. Centers for Medicare and Medicaid Services, Office of the Chief Actuary
Who pays for public health?

U.S. Centers for Medicare and Medicaid Services, Office of the Chief Actuary
Challenges in public health delivery

- Lack of clear, coherent mission and expectations
- Complex, fragmented, variable financing and delivery systems
- Resources ≠ preventable disease burden
- Large inequities in resources & capacity
- Variable productivity and efficiency
- Gaps in evidence base for public health delivery
- Inability to demonstrate value/return on investment
Public Health in the Affordable Care Act

$15 billion in new federal public health spending over 10 years (cut by $5B in 2012)

Public Health and Prevention Trust Fund

Incentives for hospitals, health insurers to invest in public health and prevention
Subtitle D—Support for Prevention and Public Health Innovation

Patient Protection and Affordable Care Act of 2010

SEC. 4301. RESEARCH ON OPTIMIZING THE DELIVERY OF PUBLIC HEALTH SERVICES.

(a) IN GENERAL.—The Secretary of Health and Human Services (referred to in this section as the “Secretary”), acting through the Director of the Centers for Disease Control and Prevention, shall provide funding for research in the area of public health services and systems.

(b) REQUIREMENTS OF RESEARCH.—Research supported under this section shall include—

(1) examining evidence-based practices relating to prevention, with a particular focus on high priority areas as identified by the Secretary in the National Prevention Strategy or Healthy People 2020, and including comparing community-based public health interventions in terms of effectiveness and cost;

(2) analyzing the translation of interventions from academic settings to real world settings; and

(3) identifying effective strategies for organizing, financing, or delivering public health services in real world community settings, including comparing State and local health department structures and systems in terms of effectiveness and cost.
2012 Institute of Medicine
Recommendations

◆ Double current federal spending on public health
◆ Identify components and costs of a “minimum package” of public health activities
◆ Allow greater flexibility in how states and localities use federal public health funds
◆ Implement national chart of accounts for tracking spending levels and flow of funds
◆ Expand research on costs and effects of public health delivery

Some research questions of interest…

- How does *public health* spending vary across communities and change over time?
- What are the health effects attributable to changes in public health spending?
- What are the medical cost effects attributable to changes in public health spending?
The problem with public health financing

- Federal & state funding sources often targeted to communities based in part on disease burden, risk, need
- Local funding sources often dependent on local economic conditions that may also influence health
- Public health spending may be correlated with other resources that influence health

Sources of Local Public Health Agency Revenue, 2005

- Medicaid 9%
- Medicare 2%
- Medicaid 9%
- Federal direct 7%
- Federal pass-thru 13%
- Other 12%
- Local 28%
- State direct 23%

NACCHO 2005
Example: cross-sectional association between PH spending and mortality

- Public health spending/capita
- Heart disease mortality

Quintile of public health spending/capita:
- Quintile 1
- Quintile 2
- Quintile 3
- Quintile 4
- Quintile 5

Deaths per 100,000
Example: cross-sectional association between PH spending and Medical spending

Quintiles of public health spending/capita

Mays et al. 2009
Estimating public health spending effects

**Approaches**

1. Cross-sectional regression: control for *observable* confounders
2. Fixed effects: also control for *time-invariant, unmeasured* differences between communities
3. IV: use exogenous sources of variation in spending
4. Discriminate between causes of death amenable vs. non-amendable to PH intervention
Data used in empirical work

- Residual state and federal spending estimates from US Census of Governments and Consolidated Federal Funding Report
- Community characteristics obtained from Census and Area Resource File (ARF)
- Community mortality data obtained from CDC’s Compressed Mortality File
- HSA-level medical care spending data from CMS and Dartmouth Atlas (Medicare claims data)
Analytical approach

- Dependent variables
  - Age-adjusted mortality rates, conditions sensitive to public health interventions
  - Medical care spending per recipient (Medicare as proxy)

- Independent variables of interest
  - Local PH spending per capita, all sources
  - Residual state spending per capita (funds not passed thru to local agencies)
  - Residual federal spending per capita

- Analytic strategy for panel data: 1993-2008
  - Fixed effects estimation
  - Random effects with instrumental variables (IV)
Analytical approach: IV estimation

- Identify exogenous sources of variation in spending that are unrelated to outcomes
  - Governance structures: local boards of health
  - Decision-making authority: agency, board, local, state

- Controls for unmeasured factors that jointly influence spending and outcomes
Analytical approach

- Semi-logarithmic multivariate regression models used to test associations between spending, service delivery, and outcomes while controlling for other factors

\[
\ln(\text{PH}\$_{ijt}) = \beta_{\text{Agency}_{ijt}} + \delta_{\text{Community}_{ijt}} + \lambda_{\text{State}_{jt}} + \mu_j + \varphi_t + \epsilon_{ijt}
\]

\[
\ln(\text{Mortality}_{ijt}) = \alpha \ln(\text{PH}\$_{ijt-1}) + \beta_{\text{Agency}_{ijt}} + \delta_{\text{Community}_{ijt}} + \lambda_{\text{State}_{jt-1}} + \mu_j + \varphi_t + \epsilon_{ijt}
\]

\[
\ln(\text{Medical}\$_{ijt}) = \alpha \ln(\text{PH}\$_{ijt-1}) + \beta_{\text{Agency}_{ijt}} + \delta_{\text{Community}_{ijt}} + \lambda_{\text{State}_{jt-1}} + \mu_j + \varphi_t + \epsilon_{ijt}
\]

Sensitivity analyses using 1, 5, and 10 year lag structures
Analytical approach

Other Variables Used in the Models

- **Agency characteristics**: type of government jurisdiction, scope of services offered, *local governance and decision-making structures*

- **Community characteristics**: population size, rural-urban, poverty, income per capita, education attainment, unemployment, age distributions, physicians per capita, CHC funding per low income, health insurance coverage, local health care wage index

- **State characteristics**: Private insurance coverage, Medicaid coverage, state fixed effects
Variation in Local Public Health Spending

Gini = 0.485

Mays et al. forthcoming 2013
Projected effects of ACA public health spending

10% increase in public health spending in average community:

- Public health cost: $594,291
- Medical cost offset: -$515,114 (Medicare only)
- LY gained: 148
- Net cost/LY: $534

Mays et al. forthcoming 2013
More questions of interest

- Who contributes to public health delivery?
- How are roles and responsibilities divided?
- How and why do delivery systems vary and change over time?
- How do system structures affect public health delivery and outcomes?
Defining public health delivery systems

The collection of governmental and private actors that contribute to the delivery of public health services for a defined population.

- Intergovernmental and public-private relationships
- Vertical and horizontal relationships
- Division of responsibility
Why is organizational structure important?

Other organizations may:

- Complement or substitute for PH agency work
- Extend the reach of PH agencies
- Bring new resources and expertise

Improve quality
Enhance efficiency
Reduce disparities
Why is organizational structure important?

Also some potential problems:

- Lack of clarity/accountability about responsibilities
- Duplication, competition, or rivalry
- Gaps in service due to incomplete coordination
- Instability in contributions over time
  - Diminished quality
  - Inconsistent service
  - Inefficiency/waste
Critical dimensions of delivery system structure

- Scope of activities performed (Diversification)
- Breadth of organizations involved (Integration)
- Governmental agency’s role (Centralization)

-Bazzoli, Shortell et al. 1999; 2004
Data used in empirical work

- National Longitudinal Survey of Public Health Systems
- Cohort of 360 communities with at least 100,000 residents
- Measures:
  - **Scope**: availability of 20 recommended PH activities
  - **Centralization**: effort contributed by the local PH agency
  - **Integration**: other organizations contributing to activities
  - **“Quality”**: perceived effectiveness of each activity
- Linked with secondary data on agency and community characteristics
  - **Scale**: population size served
  - **Cost**: Local public health agency expenditures
  - Agency and area characteristics
Data and Methods

- Hierarchical cluster analysis to classify systems based on structural attributes
- Network analysis to characterize systems and organizations based on patterns of interaction
  - Network centralization
  - Organizational degree centrality
  - Organizational betweenness centrality
- Multinomial logit estimation to examine institutional & economic factors associated with structural change
- Fixed-effects regression models to estimate the effects of structural change on measures of service delivery and population health
National Longitudinal Survey of Public Health Systems

More questions of interest...

- How can we derive greater value from existing public health delivery systems & resources?
- Are there economies of scale and scope in the delivery of public health services?
- Can regionalization improve availability, efficiency & effectiveness of public health services?
Economies of scale and scope in public health delivery systems

Jurisdiction Size

% of Agencies

% of Population Served

Source: 2010 NACCHO National Profile of Local Health Departments Survey
Sources of Scale and Scope Effects

Economies of Scale
- Spread fixed costs of public health activities
- Allow specialization of labor and capital
- Enhance predictability of infrequent events
- Pool surge capacity
- Learn by doing
- Internalize spill-over effects
- Network effects

Economies of Scope
- Use common infrastructure for multiple activities
- Cross-train workforce
- Realize synergies across activities
- Network effects
Sources of Scale and Scope Effects

Predicted Per Capita Public Health Expenditures

Population (in thousands)

Source: Santerre R; 2009
Sources of Scale and Scope Effects

Source: Mays GP et al; 2006
Analytic Approach

- Estimate the effects of *scale* (population served) and *scope* (array of activities delivered) on:
  - public health expenditures
  - health outcomes (preventable mortality)

- Address the potential endogeneity of scope, quality

- Simulate the effects of regionalizing jurisdictions that fall below selected population thresholds
  - <25,000
  - <50,000
  - <100,000
  - <150,000
Data used in empirical work

- National Longitudinal Survey of Public Health Systems
- Cohort of 360 communities with at least 100,000 residents

Measures:
- **Scope**: availability of 20 public health activities
- **Effort**: contributed by the local public health agency
- **“Quality”**: perceived effectiveness of each activity
- **Network**: organizations contributing to each activity

Linked with data from NACCHO Profile
- **Scale**: population size served
- **Cost**: Local public health agency expenditures
- Agency characteristics
Data used in empirical work

- Survey data linked with secondary sources of area characteristics (Census, ARF)
- Small sample of jurisdictions under 100,000 (n=36) used to evaluate prediction accuracy
Analytical approach

Cost Function Model (semi trans-log)

\[ \ln(\text{Cost}_{ijt}) = \alpha_1 \text{Scale}_{ijt} + \alpha_2 \text{Scale}^2_{ijt} + \beta_1 \text{Scope}_{ijt} + \beta_2 \text{Scope}^2_{ijt} + \phi_1 \text{Quality}_{ijt} + \phi_2 \text{Quality}^2_{ijt} + \lambda X_{ijt} + \mu_j + \phi_t + \epsilon_{ijt} \]

Instrumental Variables Model

\[ \text{Scope}_{ijt} = \theta \text{Network}_{ijt} + \lambda \text{Agency}_{ijt} + \delta \text{Community}_{ijt} + \mu_j + \phi_t + \epsilon_{ijt} \]
\[ \text{Quality}_{ijt} = \theta \text{Network}_{ijt} + \lambda \text{Agency}_{ijt} + \delta \text{Community}_{ijt} + \mu_j + \phi_t + \epsilon_{ijt} \]

IVs: Network: degree centrality, average path length

All models control for type of jurisdiction, governance structure, centralization, population density, metropolitan area designation, income per capita, unemployment, racial composition, age distribution, educational attainment, physician and hospital availability

Some Conclusions & Implications: Spending

- Local public health spending varies widely across communities.
- Communities with higher spending experience lower mortality from leading preventable causes of death.
- Growth in local public health spending appears to offset growth in medical care spending.
Some Conclusions & Implications: Spending

- Mortality reductions achievable through increases in public health spending may equal or exceed the reductions produced by similar expansions in local medical care resources.

- Increased federal investments may help to reduce geographic disparities in population health and bend the medical cost curve.

- Gains from federal investments may be offset by reductions in state and local spending.
Limitations and next steps: Spending

- Aggregate spending measures
  - Average effects
  - Role of allocation decisions?
- Mortality – distal measures with long incubation periods
- Medical care spending relies on Medicare as a proxy measure (20% of total medical $)
- Ongoing exploration of lag structures
Some Conclusions & Implications: Delivery System Structure

- Hospital and health insurer contributions may accentuate the impact of government agency reductions in public health delivery due to complementarities.

- Physician practices and CHCs attenuate government reductions due to substitution effects

- Health system stakeholders respond differently to policy incentives and economic constraints that shape public health delivery.

- Private-sector contributions to public health appear to offset governmental reductions under certain organizational and community conditions.
Some Conclusions & Implications: Delivery System Structure

- Significant scale and scope effects are apparent in local public health production
- Gains from regionalization may accrue through efficiency, scope, and quality
- Largest regionalization gains accrue to smallest jurisdictions
- If savings are re-invested in public health production, possibility of important health gains
Toward a “rapid-learning system” in public health

In a learning health care system, research influences practice and practice influences research.

Evaluate
Collect data and analyze results to show what does and does not work.

Implement
Apply the plan in pilot and control settings.

Design
Design care and evaluation based on evidence generated here and elsewhere.

Adjust
Use evidence to influence continual improvement.

Disseminate
Share results to improve care for everyone.

Internal and External Scan
Identify problems and potentially innovative solutions.

Public Health Practice-Based Research Networks (PBRNs)

- First cohort (December 2008 start-up)
- Second cohort (January 2010 start-up)
- Affiliate/Emerging PBRNs (2011-13)
