ACCEPTABLE PAINTS, COATINGS, SEALANTS AND LINERS FOR POTABLE WATER SYSTEMS (UPDATE - 1988)

Joseph L. Taraba
Associate Extension Professor
Department of Agricultural Engineering

The maintenance of safe drinking water from an individual domestic water supply requires the use of materials that do not degrade the water by adding contaminants that increase health risk to humans. Paints, coatings, sealants or liners are used in the construction and maintenance of wells, ponds and cistern water supply systems. The accompanying list is provided as an aid to the homeowner in choosing material(s) that will not contaminate the water.

Paints, coatings, sealants and liners can potentially release trace chemical substances to the water in which they are in contact with by the processes of diffusion, leaching or erosion. These chemical substances may be originally present in the material or may be produced as a result of gaining, deterioration or reaction with the water.

Four federal laws apply to such "additives or contaminants": The Toxic Substances Control Act, The Safe Drinking Water Act and The Insecticide, Fungicide and Rodenticide Act which are implemented by the U.S. Environmental Protection Agency (USEPA); and the Federal Food, Drug and cosmetic Act implemented by the Food and Drug Administration (FDA). To resolve the conflicts that would arise from two agencies administering their respective laws concerning drinking water, a memorandum of agreement (Federal Register, Vol. 44, No. 141, 42775-8, July 20, 1979) between the USEPA and FDA established the prime responsibility be with the USEPA. The USEPA reviews proposed products for use in domestic water supply systems prior to their manufacture. New products, new uses of existing products, new chemical formulations or new production processes for existing products must be submitted to USEPA prior to manufacture.

In testing and evaluating the materials that may add chemical substances to the drinking water, the USEPA is guided by a policy of reducing public health risks to the degree that it is feasible to do so for public drinking water systems. The toxicological advisories also state that a product is acceptable for use in public water supply systems based on the condition that the product is applied and/or utilized according to the manufacturers specifications. These specifications were utilized as the conditions under which the material was approved by the USEPA.

The following is a list of paints, coatings, sealants and liners acceptable to the USEPA for use in public water supply systems. This list is also approved by the Commonwealth of Kentucky and maintained by the Water Supply Section, Division of Water, Department of Natural Resources and Environmental Protection. This list is dated April 1987.
