1.0 Introduction

This is a study undertaken on behalf of the Kentucky Transportation Cabinet (KYTC). There are two main objectives of the Freight Movement and Intermodal Access in Kentucky Study (SPR 98-189): 1) evaluation of the access for trucks between intermodal or other truck generating sites and the National Highway System (NHS); and 2) furthering the understanding of freight commodity flows throughout the state. This report summarizes the access evaluation for the areas around the Standiford Field Louisville Airport. This includes two large generators off of Fern Valley Road: Ford Motor Company and the United Parcel Service. These sites are located in Jefferson County in the KIPDA Area Development District (ADD) and KYTC Highway District #5. The location of the site and routes is shown in Figure 1. Smaller industries to the west of the airport field along Crittendon Avenue include Akzo Nobel Trucking, General Electric Supply, KT Shannon Lumber Company, Airside Commerce Center, United Catalyst Incorporated, and Rapid Runner Warehousing. Work on other specific sites throughout Kentucky as well as the freight commodity flow task is ongoing and documented elsewhere.

The sites to be evaluated in this study were selected from two existing databases (a truck facility survey from 1994 and the intermodal facility inventory) based on ADD and KYTC Highway District planner recommendations, geographic location, distance to the NHS, and the number of trucks accessing the site. Consideration was also made for the freight type handled and transportation modes used.

The site was visited for video recording on November 21, 1998, data collection on September 29, 1998 and intersection traffic counts on December 15, 1998. The facilities are located south of I-264 and west of I-65 in Louisville either on or adjacent to the airport facility. The surrounding area is generally urban and fairly commercial/industrial. A phone survey was conducted with a UPS facility manager early in the study process. The survey found that approximately 150 trucks per day normally access the site with as many as 400 in the peak of the year. The most common truck is a 28-foot drop van but trucks as large as 53-foot semi-trailers also access the site. No traffic congestion problems were raised. Attempts to contact other large truck generators in the area were unsuccessful. The phone survey is in Appendix A.

2.0 Truck Routes in Use

As shown in Figure 1, there are two routes to reach the NHS (Interstates 65 and 264) which will be evaluated. The route to the west of the airport provides access to the smaller light industrial sites. Although Crittendon Avenue previously continued south along the airport property to Fern Valley Road which connects to I-65, a section of this road has been closed as part of a larger reconstruction of airport access roads which include the completion of Grade Lane to the east of the airfield. Therefore, trucks from these smaller industrial sites travel north on Crittendon Avenue and access the NHS via an interchange with I-264. The interchanges in this area are somewhat confusing when exiting I-264 as ramps separate and merge to provide access to the passenger terminals, the Kentucky Fair and Exposition Grounds as well as I-65.
Figure 1: Location of Truck Generating Site
The second route to be evaluated is found to the south and east of the airfield. The route starts at the I-65 interchange with Fern Valley Road, turns right at Grade Lane and continues adjacent the airfield to the interchange with I-65. Trucks coming from or going to I-65 north must travel a small distance on the Preston Highway (KY 61) at this more northern interchange. Obviously trucks accessing the Ford Motor Company or UPS would only use one or the other half of this route to gain access to I-65. For ease, the route is evaluated as a whole.

Crittendon Drive to the west of the airfield (shown in Figure 2) has four 12-foot lanes with a turf shoulder that varies in width. This road has a total length of 1.4 miles and is no longer state-maintained. Fern Valley Road (shown in Figure 3) is KY1631 and has four 12-foot lanes with paved 10-foot shoulders. The western portion of the road has a two-way left turn lane in the center. Fern Valley Road now dead ends approximately 1500 feet beyond the intersection with Grade Lane. A total of 0.75 miles of the truck access route lies along Fern Valley Road. This section has an ADT of 30,819 (KYTC HIS data). Grade Lane is shown in Figure 4. This curbed section has 12-foot lanes (wider in some locations). The section varies from two to four-lanes and has some curbed sections while others have gravel shoulders. The total distance from Fern Valley to I-65 along Grade Lane is 2 miles. Grade Lane is state-maintained and is also known as KY 2843.

3.0 Route Data Collection and Evaluation

The route features that are to be evaluated in this study are shown in Table 1 along with a brief description of the evaluation method. While some of these features required only subjective evaluation by the engineer during site inspection, others required quantitative measurement in order to label the particular point or section as “preferred,” “adequate” or “less than adequate” for truck access. The guidelines for labeling a point or section into one of these three descriptive categories are provided in both the interim and final report for this project. In several cases measurements were only taken where subjective evaluation indicated a problem might exist.

3.1 Traffic Operations and Level of Service

The survey of this site indicated that traffic backups occur in the right hand lane of the intersection of Grade Lane with the Preston Highway (KY 61) during the weekday PM peak. Traffic counts for a level of service evaluation at the signalized intersection were conducted. Detailed results can be found in Appendix B. The LOS was determined using the Highway Capacity Manual software assuming random arrivals and fixed timing based on an estimate of the timing plan during the time of evaluation. The overall estimate of LOS is D. This might be considered reasonable for an urban area arterial during the peak periods. However, this intersection should be flagged as a possible concern if truck or total traffic is expected to grow in the areas. Further investigation might reveal the problem could be solved through changes in traffic signal timing.

3.2 Accident History

In 1997, the Kentucky Transportation Center studied all state-maintained roads throughout Kentucky and determined average truck accident rates for different types of road sections. A critical accident rate was then calculated using the average accident rate for a specific highway type along with an assumed level of statistical significance and exposure (vehicle miles traveled). The section of KY 1631, Fern Valley Road, had a critical truck accident rate factor of 1.32, indicating a possible truck accident problem. The truck accident rate is 32% higher than would be considered critical on a four-lane urban arterial.

A summary of the accidents along the truck routes is shown in Tables 2 through 4 for 1995 through 1997. Truck accidents represent a moderate percent of the overall accidents along both the routes but are higher on Fern Valley Road. These results indicate that there are truck accident safety issues that may require further investigation. As indicated in subsequent sections of this report very few geometric deficiencies exist along these routes which might contribute to accidents.

3.3 Cross Section Features

All sections of these three routes have at least 12-foot lanes that are considered “preferred” in this study. Figure 5 illustrates the sections of the routes having different widths and types of shoulders. The 10-foot paved shoulders are considered “preferred” while all others are rated “less than adequate”.

The pavement was good on Grade Lane and Fern Valley Road but only fair on Crittendon Avenue. The clear zone on Crittendon Avenue is obstructed by utility poles and the airport fence.
A few minor obstructions were noted on Grade Lane.

3.4 Curvature Features

Grades are considered problematic if they cause trucks to slow down excessively. No such grades were found on these routes.

Offtracking is considered a problem where a truck cannot stay in its lane through a curve. No such horizontal curve offtracking problems were found on this route. Safe speed problems on curves did not exist on these routes.

The right turning radius at the intersection of Fern Valley Road and Grade Lane was noted during the phone survey as problematic. There is a very small right turning bay for traffic making this movement. The turn is tight, but trucks can make the turn from the right most lane and do not offtrack into opposing or adjacent lanes. Therefore, the turn is rated “preferred.”
Figure 5: Shoulder Widths
3.5 Railroad Crossings

There were no at-grade railroad crossings on these routes.

3.6 Bridges

There are two bridges on these routes. One is the overpass on Fern Valley Road over I-65. The other is a bridge approximately 0.2 miles south of I-264 interchange on Crittendon Avenue. The bridge sufficiency rating (provided by the KYTC Division of Operations) for the overpass is 90.8. A sufficiency rating of 80 or higher (out of a possible 100) is considered “preferred,” and a rating of at least 50 is “adequate.” Therefore the overpass bridge is rated “preferred”. The Crittendon Avenue bridge could not be found in the KYTC database and the Division of Operations is investigating this omission.

3.7 Sight Distance

There were no sight distance problems noted on this route.

4.0 Route Evaluation and Recommendations

4.1 Problem Truck Miles and Truck Points

In order to compare different routes to consider relative urgency of needed route improvements the features rated “preferred,” “adequate” and “less than adequate” along a route have been normalized for the number of miles, number of points and number of trucks using the route section. In the case of these Jefferson County routes, only one feature that was evaluated quantitatively has sections that are considered only “adequate” or “less than adequate.” A section or point that is considered “less than adequate” is weighted two times that of an “adequate” point or section. Less than “preferred” sections are weighted by length as well as the number of trucks passing that point. The number of trucks was obtained from KYTC HIS data and based on phone survey information. Truck volumes on Crittendon Avenue after the closure of the extension around the south of the airfield to Fern Valley Road is unknown.

Table 5 contains the total problem truck miles for shoulders. The rating of the routes relative to others evaluated will be reported in the final report.

4.2 Maintenance Improvement Locations

No specific deficiencies that could be addressed through routine maintainence were noted for these routes.
4.3 Overall Route Rating

In order to account for both the subjectively and objectively evaluated route features along truck routes throughout the state, UK engineers who studied the route and its features either during a site visit or by viewing a video of trucks using the routes have rated the overall access on a scale of 1 through 10. The interpretation for these ratings is shown in Table 6. Both these routes are assigned a rating of 10 indicating that minor problems exist that do not seriously impede truck traffic.

</tbody>
</table>
4.4 Conclusions and Recommendations

In conclusion, the following problems were identified along the truck route:

- Minor shoulders deficiencies, and
- One section with a critically high truck accident rate.

Trucks are served with good access at this site. A minor improvement for the right turning bay at Fern Valley Road and Grade Lane might be considered. Further investigation as to the reasons for the high truck accident rates on Fern Valley Road might also be considered.
Appendices
APPENDIX A: PHONE SURVEY RESULTS

Facility ID Facility Name Location / City County ADD
6 UPS Louisville Jefferson KIPDA

Contact Name Title Phone Fax
Kirk Senn

1. Is the location of your facility on the map correct? 911 Grade Lane
2. Our information shows about 150 each way trucks per day access your facility. Is that correct? If not, fill in correct volume.

3. Is the truck traffic to and from your facility seasonal or mostly constant?

4. (If truck traffic is seasonal) Is the ___ trucks/day for the peak season?
   Peak 420 total both ways
5. What is the most common size truck operating at your facility?
   28’ drop van
6. What is the largest truck operating at your facility?
   53’ semitrailer
7. What type of freight or commodity is shipped, and is incoming and outgoing freight different? (one may be an empty truck)

8. Does the truck traffic peak at specific times of the day? (e.g., out in the morning and return in the afternoon) Noon - 4 p.m. Peak

9. What traffic congestion and delay problems along the routes are you aware of, or feel need improvement?
   Location (route segment, intersection, etc.) Time and Day of Week
   3 - 5 p.m. Grade Lane right turn onto Preston Highway

10. Where do trucks at your facility go to and come from? (This may be an interstate, cities, general direction-N, S, E, W) Knoxville, Nashville, Paducah, Mt. Vernon (IL.), Kokomo (IN), Columbus (OH), Charleston - all directions 3.5 to 4.5 hours

11. Do you have any other problems or concerns along the route you would like us to consider? HUB 2000 —> +50 in/out 5 year projection

12. Would you like a copy of the final report (roadway/route evaluation ???)
   Yes
