The XXIII International Grassland Congress (Sustainable use of Grassland Resources for Forage Production, Biodiversity and Environmental Protection) took place in New Delhi, India from November 20 through November 24, 2015.

Published by Range Management Society of India

This Event is brought to you for free and open access by the Plant and Soil Sciences at UKnowledge. It has been accepted for inclusion in International Grassland Congress Proceedings by an authorized administrator of UKnowledge. For more information, please contact UKnowledge@lsv.uky.edu.
Evaluation of nutritive value of *Azolla pinnata*

**Keywords:** Azolla, Nutritive value

**Introduction**

The water fern *Azolla*, which grows in association with the blue-green algae *Anabaena azollae*, a nitrogen fixing organism, is the most promising from the point of view of ease of cultivation, productivity and nutritive value. It grows naturally in stagnant water of drains, canals, ponds, rivers, marshy lands. *Azolla* can be used in animal feed and it is a potential feed ingredient for livestock; it is an income generating crop. *Azolla* is easily propagated but requires abundant standing water, relative humidity of 85-90%, pH of 4.5-6.5, salinity between 90-150 mg/L and adequate phosphorus for its nutritional needs. It is labour intensive, grows fast. *Azolla* doubles its weight in 3-5 days. From a start of 1t/ha, it can reach a fresh weight of 15-20 t/ha in about 20 days. *Azolla* is rich in protein, essential amino acids, vitamins and minerals.

**Materials and Methods**

Whole plants of *Azolla pinnata* were collected and washed properly in running fresh water. The sample was dried in oven at 100±2°C for 48 hours, weighed and stored for chemical analysis. Sample of the *Azolla* was chemically analyzed in triplicates according to AOAC (2000). Crude protein was calculated by multiplying N×6.25. Total ash content was measured by ignition of the dried sample in muffle furnace at 600°C for 4 hours. The per cent organic matter in the sample was determined by subtracting per cent ash contents of the samples from 100. Neutral detergent fiber (NDF) and acid detergent fiber (ADF) were determined.

**Results and Discussion**

The proximate analysis of the *Azolla pinnata* shows that it contain 8.42% dry matter, 20.20% crude protein, 3.53% ether extract, 12.12% crude fiber, 15.53% ash, 40.20% nitrogen free extract and 84.47% organic matter. (Table1) *Azolla* contain 35.18% neutral detergent fiber (NDF) and 45.88% acid detergent fiber (ADF). Earlier reports indicated that the crude protein content of *Azolla* might vary from 13.0 to 34.5%. The crude fibre content of *Azolla* not exceeds or equals its protein content. Thus the tendency to depress the overall crude protein digestibility when it constitutes a significant portion of the diet is low. Its nutrient composition makes it a highly efficient and effective feed for livestock.

**Conclusion**

Based on the results of the study, it could be concluded that *Azolla* is a potential source of nitrogen and thereby a potential feed ingredient for livestock. Livestock easily digest it due to its low lignin content. *Azolla* can be mixed with concentrates or can be given directly to Livestock. So *Azolla* is considered as the most economic and efficient feed substitute and a sustainable feed for livestock.
