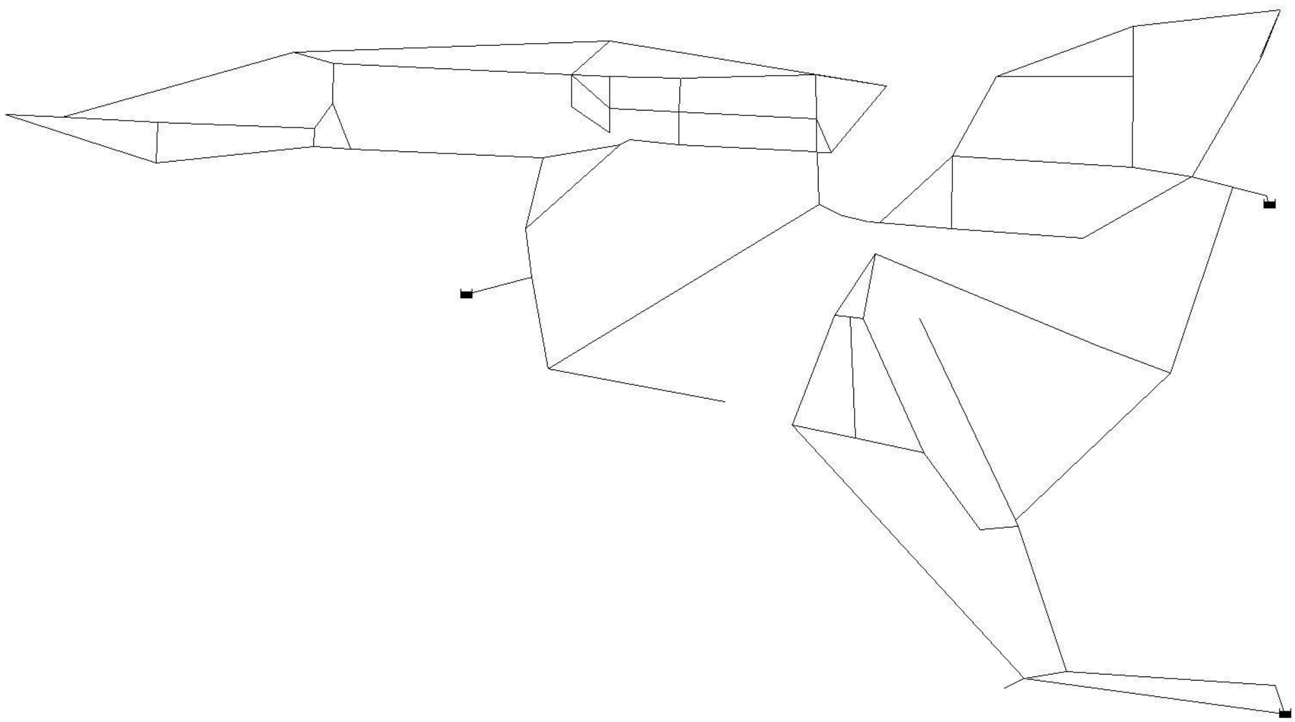
SYSTEM ID: Pescara

NARRATIVE DESCRIPTION

The Pescara system is a simplified version of the water distribution system in the small town of Pescara, Italy. The system has an average demand of 57,000 CMD. The network was first presented by Bragalli et al. (2008) as part of a design study. A general schematic of the system is shown below. The system has three reservoirs and 49 kilometers of pipe.

NETWORK SCHEMATIC:



HISTORY OF THE NETWORK FILE

The Pescara system was originally developed by Bragalli et al. (2011) using mixed integer nonlinear programming. Since then, it was optimized in various studies using the multi-objective hybrid approach (Creach & Fanchini, 2014) and by incorporating domain knowledge into a genetic algorithm model (Bi et al., 2014).

ABSTRACT: A new computer model called Genetic Algorithm Pipe Network Optimization Model (GENOME) has been developed with the aim of optimizing the design of new looped irrigation water distribution networks. The model is based on a genetic algorithm method, although relevant modifications and improvements have been implemented to adapt the model to this specific problem. It makes use of the robust network solver EPANET. The model has been tested and validated by applying it to the least cost optimization of several benchmark networks reported in the literature. The results obtained with GENOME have been compared with those found in previous works, obtaining the same results as the best published in the literature to date. Once the model was validated, the optimization of a real complex irrigation network was carried out to evaluate the potential of the genetic algorithm for the optimal design of large-scale networks. Although satisfactory results have been obtained, some adjustments would be desirable to improve the performance of genetic algorithms when the complexity of the network requires it.

AVAILABLE INFORMATION

Physical attributes	Yes
Schematic diagram	Yes
Network geometry data	Yes
GIS data file	No
Background map	No
Elevation data	Yes
Pipe data	Yes
Pipe material	No
Pipe age	No
Pipe pressure class	No
Nominal or actual diameters	Nominal
Pump data	NA
Useful horsepower	
Pump operating curves	
Tank data	NA
Elevation data	
Stage storage curves	
Water quality information	
Valve data	NA
PRV/FCV data	
Isolation valve data	
Hydrant data	
Demand data	Yes
Total system demand	No
Nodal demand data	Yes
Temporal data demands	No
System leakage	No
Hydraulic data	No
Hydraulically calibrated model	
Field hydraulic calibration data	
Water quality data	No
Disinfection method	
Chlorine residual data	
Booster station data	
Fluoride/Chloride field data	
Water quality calibrated model	
Operational data	No

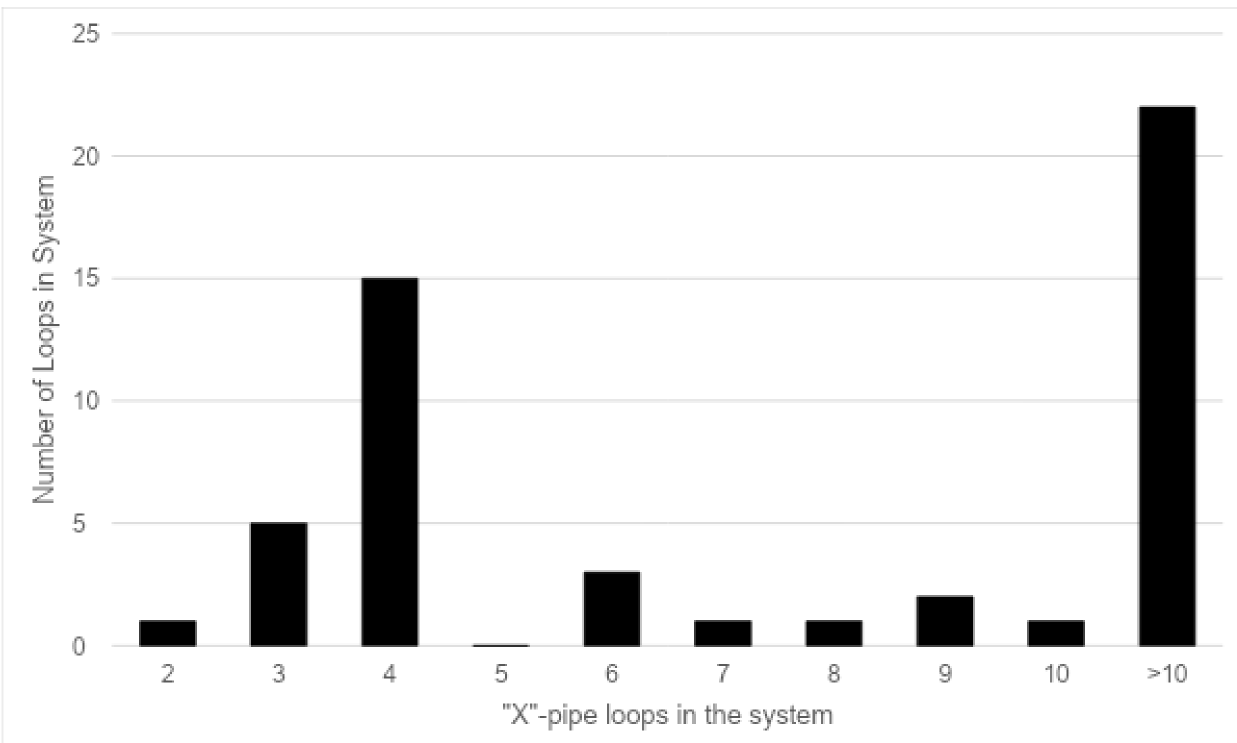
SYSTEM CLASSIFICATION:

PIPE/LOOP HISTOGRAM:

Hoagland et al. (2015) designed a network classification algorithm for use in classifying water distribution systems as either “branched,” “looped,” or “gridded” based on the observed frequency of network loops with different numbers of distinct pipe segments. The frequency distribution for the Pescara system is provided below. Using this information, Hoagland et al., classified this system as being a LOOPED system.

# Total Pipes:	99
# Branch Pipes:	12
Ratio (Branch Pipes / Total Pipes):	0.12



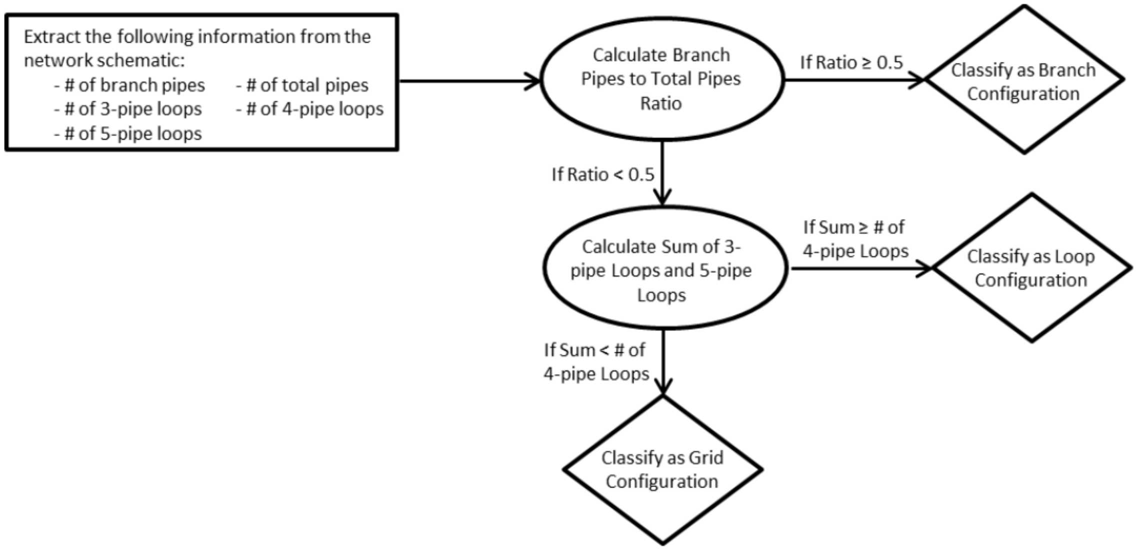


Figure 3.4. Classification Algorithm (Hoagland et al., 2015)

NETWORK STRUCTURE METRICS:

Building on the work of Hoagland et al., (2015), Hwang & Lansey (2017) created an expanded classification system that allows for further classification of a system as being either a transmission or distribution branched, looped, gridded, or hybrid system. Their algorithm streamlines the classification system by removing unnecessary nodes that do not contribute to the structure of the system while still retaining their use as intermediate points for demand data entry. A full description of the algorithm can be found in the cited reference.

Application of the Hwang and Lansey classification algorithm to the system yields the following statics and associated classification:

Parameter	Value
Edges	99
Pipes	99
Nodes	71
Average Diameter	133
Reduced Nodes	64
Reduced Edges	92
Branched Edges	7
Branched Index	0.1
Meshed Connectedness	0
Reduced Meshed Connectedness	0.24
Link Density	0
Average Node Degree	3
Hwang & Lansey Classification	Distribution Dense-Grid
