2016 Heart of America Grazing Conference
Pennington

Honors the Distinguished Career of Dr. Garry Lacefield
With the Release of Lacefield MaxQ II
A Certified Novel Endophyte Tall Fescue Variety
Developed by The University of Kentucky
Kentucky Forage and Grasslands Council
www.kfgc.org

Forages are produced on more open land in Kentucky than any other crop. About seven million acres are used to produce forage crops annually. This includes about 35,000 acres of corn silage, 280,000 acres of alfalfa, 2.5 million acres of grass and grass-legume hay, and at least 7 million acres of perennial pastures. Forage crops are the backbone of the beef, dairy, horses and small ruminants industries. Studies have shown that feed, dairy, horses and small ruminants require more forage crops.

KFGC serves as an organization to which members committed to forage production work together to improve the forage/stock industry in Kentucky. At the same time, you will have the opportunity to volunteer that you are serving the interests of the industry by providing better land use, self-sustaining, wildlife habitat, and reduced water pollution.
Soyhulls: More than just a Feed Supplement
