USE OF PARTHENOLIDE DERIVATIVES AS ANTILEUKEMIC AND CYTOTOXIC AGENTS

FIELD OF THE INVENTION

The present invention relates to methods for the structural modification of the sesquiterpene lactone, parthenolide, and the use of these parthenolide derivatives in the treatment of carcinoma. More specifically, the invention relates to the methods to prepare structural analogs of the parent compound, parthenolide, in order to obtain new, pharmacologically active chemical entities with improved water solubility characteristics, and to use them in the treatment of leukemias and other parental and multi-drug resistant cancers.

BACKGROUND OF THE INVENTION

Sesquiterpene lactones are a group of secondary plant metabolites consisting of a 15-carbon structure containing an α-methylene-γ-butyrolactone moiety and other additional functional groups. Over the last two to three decades, these terpenoids have received considerable attention due to the broad spectrum of their biological activities, to the plants which produce them, and most importantly, because of their pharmacological effects in humans. About 4,000 of these terpenoids have been isolated and identified, most of them in Asteraceae (Compositae, sunflower family) (Schmidt, Curr. Org. Chem. 1999, 3, 577-608). Some of these plants have been used for centuries in indigenous medical practices in various cultures worldwide.

Parthenolide (1) is a Germacrene sesquiterpene lactone with a unique structure. It has been isolated from several different species in Asteraceae (Compositae) family, feverfew (Tanacetum parthenium) being one of them.

Parthenolide (1) is a lipophilic, neutral lactone with low polarity, and has a low water-solubility, limiting its development as a therapeutic agent. Thus, a need exists for the development of soluble parthenolide derivatives that retain their anti-cancer activity.

SUMMARY OF THE INVENTION

In accordance with the present invention, a novel class of compounds with antileukemic activity is presented. Accordingly, the present invention provides compounds of formula (1):

\[
\text{(I)}
\]

wherein:

- \(X_1, X_2\) and \(X_3\) are heteroatoms;
- \(R_4, R_5, R_6, R_7, R_8, R_9\) and \(R_{10}\) are independently selected from \(H\), halo, \(-\text{OH}\), \(-\text{NO}_2\), \(-\text{CN}\) and optionally substituted aliphatic, cycloalkyl, heterocycloalkyl, aryl or heteroaryl; and
- \(Z\) is optionally substituted \(\text{C}_{1-8}\) straight-chained or branched aliphatic, optionally containing 1 or more double or triple bonds, wherein one or more carbons are optionally replaced by \(R^*\) wherein \(R^*\) is optionally substituted cycloalkyl, heterocycloalkyl, aryl or heteroaryl; an amino acid residue, \(\text{H}, -\text{CN}, -\text{C}(=\text{O})-, -\text{C}(=\text{O})(=\text{O})-, -\text{C}(=\text{O})\text{NR}^2-, -\text{C}(=\text{O})\text{NR}^2\text{NR}^2-, -\text{C}(=\text{O})\text{O}-, -\text{C}(=\text{O})\text{NR}^2-, -\text{O}-, -\text{NR}^1\text{C}(=\text{O})\text{NR}^2-, -\text{OC}(=\text{O})\text{NR}^1-, -\text{NR}^1\text{NR}^2-, -\text{NR}^1\text{C}(=\text{O})-, -\text{S}-, -\text{SO}-, -\text{SO}_2-, -\text{SO}_2\text{NR}^1-, -\text{NR}^2\text{R}^2-, \text{or } -\text{NR}^1\text{SO}_2-, \text{wherein } R^1 \text{ and } R^2 \text{ are independently selected from } H \text{ and optionally substituted cycloalkyl, heterocycloalkyl, aryl or heteroaryl}; or \(R^*\) is \(\text{NR}^2\text{R}^2, R^1\) and \(R^2\) optionally together with the nitrogen atom form an optionally substituted 5-12 membered ring, said ring optionally comprising 1 or more heteroatoms and/or a group selected from \(-\text{CO}-, -\text{SO}-, -\text{SO}_2-\) and \(-\text{PO}-; or
- a pharmaceutically acceptable salt, ester or prodrug thereof.

The invention also provides a pharmaceutical composition comprising an effective amount of a compound of formula (I), or a pharmaceutically acceptable salt, ester or prodrug thereof, in combination with a pharmaceutically acceptable diluent or carrier.

The invention also provides a method of inhibiting cancer cell growth and metastasis of cancer cells, comprising administering to a mammal afflicted with cancer, an amount of a compound of formula (I), effective to inhibit the growth of said cancer cells.

The invention also provides a method comprising inhibiting cancer cell growth by contacting said cancer cell in vitro or in vivo with an amount of a compound of formula (I), effective to inhibit the growth of said cancer cell.

The invention also provides a compound of formula (I) for use in medical therapy (preferably for use in treating cancer, e.g. solid tumors), as well as the use of such compound for the...
manufacture of a medicament useful for the treatment of cancer and other diseases/disorders described herein.

The invention further provides methods of treating inflammatory diseases and disorders, including, for example, rheumatoid arthritis, osteoarthritis, allergies (such as asthma), and other inflammatory conditions, such as pain (such as migraine), swelling, fever, psoriasis, inflammatory bowel disease, gastrointestinal ulcers, cardiovascular conditions, including ischemic heart disease and atherosclerosis, partial brain damage caused by stroke, skin conditions (eczema, sunburn, acne), leukotriene-mediated inflammatory diseases of lungs, kidneys, gastrointestinal tract, skin, prostatitis and parodontosis.

The invention further provides methods of treating immune response disorders, whereby the immune response is inappropriate, excessive or lacking. Such disorders include allergic responses, transplant rejection, blood transfusion reaction, and autoimmune disorders such as systemic lupus erythematosus and rheumatoid arthritis.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 shows the effectiveness of parthenolide and derivatives of the present invention against prostate cancer cell line CWR22 in a clonogenic assay.

FIG. 2 shows the effectiveness of parthenolide and derivatives of the present invention against lung cancer cell line A-549 in a cellular proliferation MTS-PMS assay.

FIG. 3 shows the effectiveness of parthenolide and derivatives of the present invention against lung cancer cell line H-522 in a cellular proliferation MTS-PMS assay.

FIG. 4 shows the effectiveness of parthenolide and derivatives of the present invention against lung cancer cell line H-23 in a cellular proliferation MTS-PMS assay.

FIG. 5 shows the effectiveness of parthenolide and derivatives of the present invention against lung cancer cell line H-460 in a cellular proliferation MTS-PMS assay.

FIG. 6 shows the effectiveness of parthenolide and derivatives of the present invention against breast cancer cell line HBL-100 in a clonogenic assay.

FIG. 7 shows the effectiveness of parthenolide and derivatives of the present invention against breast cancer cell line MD-231 in a clonogenic assay.

FIG. 8 shows the effectiveness of parthenolide and derivatives of the present invention against breast cancer cell line MD-436 in a clonogenic assay.

FIG. 9 shows parthenolide and DMAPT plasma concentrations at one hour following oral gavage in mice.

FIG. 10 shows DMAPT dose-dependent inhibition of NF-kB DNA binding in two transitional cell carcinoma cell lines IIT-1376 and UMC-3 in electrophoretic mobility gel shift assay (EMSA).

FIG. 11 shows FSCScan analysis of TRAIL induced apoptosis assay using MDA-MB-231 breast cancer cells treated first with DMAPT, then TRAIL-IRI-activating antibodies.

FIG. 12 shows FSCScan analysis of TRAIL induced apoptosis assay using MDA-MB-231 breast cancer cells treated first with DMAPT, then TRAIL.

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the following definitions shall apply unless otherwise indicated.

The phrase "optionally substituted" is used interchangeably with the phrase "substituted or unsubstituted." Unless otherwise indicated, an optionally substituted group may have a substituent at each substitutable position of the group, and each substitution is independent of any other. Also, combinations of substituents or variables are permissible only if such combinations result in stable compounds. In addition, unless otherwise indicated, functional group radicals are independently selected. Where "optionally substituted" modifies a series of groups separated by commas (e.g., "optionally substituted A, B or C," or "A, B or C optionally substituted with"), it is intended that each of the groups (e.g., A, B and C) is optionally substituted.

The term "aliphatic" or "aliphatic group" as used herein means a straight-chain or branched C₁₋₁₂ hydrocarbon chain that is completely saturated or that contains one or more units of unsaturation, or a monocyclic C₃₋₄ hydrocarbon or bicyclic C⁵₋₁₂ hydrocarbon that is completely saturated or that contains one or more units of unsaturation, but which is not aromatic (also referred to herein as "carbo cycle" or "cycloalkyl"), that has a single point of attachment to the rest of the molecule wherein any individual ring in said bicyclic ring system has 3-7 members. For example, suitable aliphatic groups include, but are not limited to, linear or branched or alkyl, alkenyl, alkynyl groups and hybrids thereof such as (cycloalkyl)alkyl, (cycloalkenyl)alkyl or (cycloalkyl)alkenyl.

The terms "alkyl," "alkoxy," "hydroxyalkyl," "alkoxyalkyl," and "alkoxyacylcarbonyl," used alone or as part of a larger moiety include both straight and branched chains containing one to twelve carbon atoms. The terms "alkenyl" and "alkynyl" used alone or as part of a larger moiety shall include both straight and branched chains containing two to twelve carbon atoms.

The terms "haloalkyl," "haloalkenyl" and "haloalkoxy" means alkyl, alkenyl or alkoxy, as the case may be, substituted with one or more halogen atoms. The term "halogen" or "halo" means F, Cl, Br or I.

The term "heteroatom" means nitrogen, oxygen, or sulfur and includes any oxidized form of nitrogen and sulfur, and the quarternized form of any basic nitrogen. Heteroatom further includes Se, Si and P.

The term "aryl" used alone or in combination with other terms, refers to monocycclic, bicyclic or tricyclic carbocyclic ring systems having a total of five to fourteen ring members, wherein at least one ring in the system is aromatic and wherein each ring in the system contains 3 to 8 ring members. The term "aryl" may be used interchangeably with the term "aryl ring." The term "aralkyl" refers to an aryl group substituted by an aryl. The term "aralkoxy" refers to an arylalkoxy group substituted by an aryl.

The term "heterocycloalkyl," "heterocycle," "heterocyclic" or "heterocyclic" as used herein means monocyclic, bicyclic or tricyclic ring systems having five to fourteen ring members in which one or more ring members is a heteroatom, wherein each ring in the system contains 3 to 7 ring members and is non-aromatic.

The term "heteroaryl," used alone or in combination with other terms, refers to monocyclic, bicyclic and tricyclic ring systems having a total of five to fourteen ring members, and wherein: 1) at least one ring in the system is aromatic; 2) at least one ring in the system contains one or more heteroatoms; and 3) each ring in the system contains 3 to 7 ring members. The term "heteroaryl" may be used interchangeably with the term "heteroaryl ring" or the term "heteroaromatic." Examples of heteroaryl rings include 2-furanyl, 3-furanyl, N-imidazolyl, 2-imidazolyl, 4-imidazolyl, 5-imidazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-oxadiazolyl, 5-oxadiazolyl, 2-oxazolyl, 4-oxazolyl, 5-oxazolyl, 1-pyridyl, 2-pyridyl, 3-pyridyl, 1-pyrrolyl, 3-pyrrolyl, 4-pyrazolyl, 2-pyrazolyl, 3-pyridyl, 4-pyridyl, 2-pyrimdyl, 4-pyrim-
An aryl (including aralkyl, alralkoxy, aryloxalkyl and the like) or heteroaryl (including heteroar aralkyl, heteroaryloxalkyl and the like) group may contain one or more substituents.

Suitable substituents on an unsaturated carbon atom of an aryl, heteroaryl, aralkyl or heteroaryalkyl group are selected from halogen; haloalkyl; —CF₃; —R; —OR; —SR; 1,2-methylenedioxy; 1,2-ethylenedioxy; protected OH (such as acetylxy); phenyl (Ph); Ph substituted with R; —O(Ph); —C(Ph); —NO₂; —OR; —NR₂; —N(R)=C(O)R; —N=CH₂; —NR(C(O)R)₂; —NR=CH₂; —C(NR₂)=O; —C(Ph)=N(R); —C(Ph)=NR; —C(Ph)=S(R); —N=CH₂; —N=CR=O; —N=CH₂; —S(OR)₂; —SO₂R; —nh₂; —NH(aryl); —N(aryl)₂; —N=C(O)=O; —N=C(O)=NR; —N=C(O)=S(R); —C(OR)=O; —C(OR)=N(R); —C(OR)=S(R); —N(C(aryl)₂)O; —C(N(aryl)=N(R); —N(C(aryl)=O); —C(N(aryl)=S(R); —NCS; —CN; —CO₂H; —CO₂(aryl); —OH; —O—(aryl); —CN; —NO₂; —CO₂(C₆H₄)₃(aryl); —O(halo C₆H₄ aliphatic) or halo-C₆H₄ aliphatic); wherein each C₆H₄ aliphatic is optionally substituted.

The term “linker” group or “linker” means an organic moiety that connects two parts of a compound. Linkers include alkylidene chain that is a saturated or unsaturated, straight or branched, C₁₈₈₂ carbon chain which is optionally substituted, and wherein up to two non-adjacent saturated carbons of the chain are optionally replaced by R₈ wherein R₈ is —C(O)—, —C(O)(O)(C)(O)—, —C(O)(NR)—, —C(O)NNR—, —C(O)(OR)—, —OC(O)—, —NRC(O)—, —O—, —NRC(O)NR—, —O(NRC(O))NR—, —NRC(O)(OR)—, —OR—, —S—, —SO₂—, —SO₂NR—, —NR—, —SO₂NR—, or —NRSO₂— wherein R is selected from hydrogen or optionally substituted aliphatic, cycloalkyl, heterocycloalkyl, aryl or heteroaryl, and preferably H or optionally substituted C₁₈₈₈ aliphatic. Optional substituents on the alkylene chain are as described above for an aliphatic group. Alternatively, the linker group is R₈.

The term “treatment” refers to any treatment of a pathologic condition in a mammal, particularly a human, and includes: (i) preventing the pathologic condition from occurring in a subject which may be predisposed to the condition but has not yet been diagnosed with the condition and, accordingly, the treatment constitutes prophylactic treatment for the disease condition; (ii) inhibiting the pathologic condition, i.e., arresting its development; (iii) relieving the pathologic condition, i.e., causing the regression of the pathologic condition; or (iv) relieving the conditions mediated by the pathologic condition.

The term “therapeutically effective amount” refers to that amount of a compound of the invention that is sufficient to effect treatment, as defined above, when administered to a mammal in need of such treatment. The therapeutically effective amount will vary depending upon the subject and disease condition being treated, the weight and age of the subject, the severity of the disease condition, the manner of administration and the like, which can readily be determined by one of ordinary skill in the art.

The term “pharmaceutically acceptable salts” includes, but is not limited to, salts well known to those skilled in the art, for example, mono-salts (e.g. alkali metal and ammonium salts) and poly salts (e.g. di- or tri-salts) of the components of the invention. Pharmaceutically acceptable salts of compounds of formulas (I), (II), (III), or (IV) are where, for example, an exchangeable group, such as hydrogen in —OH, —NH—, or —P=O(OH)—, is replaced with a pharmaceutically acceptable cation (e.g. a sodium, potassium, or ammonium ion) and can be conveniently prepared from a corresponding compound of formula (I) by, for example, reaction with a suitable base. In cases where compounds are sufficiently basic or acidic to form stable non-toxic acid or base salts, administration of the compounds as salts may be appropriate. Examples of pharmaceutically acceptable salts are organic acid addition salts formed with acids that form a physiological acceptable anion, for example, tosylate, methanesulfonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate, a-ketoglutarate, and a-glycerophosphate. Suitable inorganic salts may also be formed, including hydrochloride, sulfate, nitrate, bicarbonate, and carbonate salts. Pharmaceutically acceptable salts include quaternary ammonium salts formed with RY; where Y is selected from halogen, tosylate, methanesulfonate, benzzenesulfonate, trifluoromethanesulfonate and the like; and R' is selected from an optionally substituted cycloalkyl, heterocycloalkyl, aryl or heteroaryl.
Suitable acids include hydrofluoric acid, hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, carbonic acid, boric acid, selenium acid, hydrogen sulfide, phosphomolybdic acid, phosphorous acid, sulfuric acid, sulfurous acid, citric acid, maleic acid, D-malic acid, L-lactic acid, D-lactic acid, DL-lactic acid, oxalic acid, methanesulfonic acid, valeric acid, oleic acid, lauric acid, pantothenesulfonic acid, 1-naphthalenesulfonic acid, 2-naphthalensulfonic acid, phthalic acid, tartaric acid, L-malic acid, DL-malic acid, malonic acid, succinic acid, fumaric acid, glycolic acid, thiglycolic acid, glycone, sarcosine, sulfonic acid, nicotinic acid, picolinic acid, isonicotinic acid, benzoic acid and substituted benzoic acid where benzene ring bears one or more substituents.

Pharmaceutically acceptable salts may be obtained using standard procedures well known in the art, for example, by reacting a sufficiently basic compound such as an amine with a suitable acid affording a physiologically acceptable anion. Alkali metal (for example, sodium, potassium or lithium) or alkaline earth metal (for example, calcium) salts of carboxylic acids can also be made.

The term “prodrugs” or “prodrugs” is used in its ordinary meaning in the art and means a compound of the invention that has its charged moiety masked or protected by another moiety that is designed to be cleaved under particular physiological conditions, leaving the deprotected or unmasked compound of the invention. The use of masking agents is common and well-known in the art and, in particular, masking phosphate or phosphonate groups. All such masking agents are suitable and can be used with the compounds of the invention. Various agents such as acetoxy alkyl esters are described by Srivasta et al., (1984 Bioorganic Chemistry 12, 118-12), and by Freeman et al. (1997 Progress in Medicinal Chemistry 54:112-147) which are each incorporated in their entirety herein by reference; and 3-phenylalkyl phosphate esters are described by Dung Q., et al., (1999 Bioorganic & Med. Chem. Letters, 9:1505-1510), which is incorporated in its entirety herein by reference. For example, and not by way of limitation, Srivasta et al. also describe acetoxyethyl, ethylbenzyl, isobutryloxyethyl, pivaloxymethyl and pivaloxymethyl as masking agents. Other suitable masking groups comprising pivaloxylalkyl, e.g., pivaloxymethyl, or a pivaloxylo group as described by Farquhar D. et al., (1995 J. Med. Chem., 38:488-495) which is incorporated in its entirety herein by reference. Still other masking or protecting agents are described in U.S. Pat. Nos. 4,816,570 and 4,968,788 both of which are incorporated in their entirety herein by reference. Lipid prodrugs are also suitable for use with the compounds of the invention. By non-limiting example, certain lipid prodrugs are described in Hostetter et al., (1997 Biochem. Pharm. 53:1815-1822), and Hostetter et al., 1996 Antiviral Research 31:59-67, both of which are incorporated in their entirety herein by reference. Additional examples of suitable prodrug technology is described in WO 90/00555; WO 96/39831; WO 03/095665A2; U.S. Pat. Nos. 5,411,947; 5,463,092; 6,312,662, 6,716,825; and U.S. Published Patent Application Nos. 2003/0229225 and 2003/0225277 each of which is incorporated in their entirety herein by reference. Such prodrugs may also possess the ability to target the drug compound to a particular tissue within the patient, e.g., liver, as described by Erion et al., (2004 J. Am. Chem. Soc. 126:5154-5163; Erion et al., Am. Soc. Pharm. & Exper. Ther. DOI: 10.1124/jept.104.75903 (2004); WO 01/1801 A1; U.S. Pat. No. 6,752,981), each of which is incorporated in their entirety herein by reference. By way of non-limiting example, other prodrugs suitable for use with the compounds of the invention are described in WO 03/009060; and by Harris et al., (2002 Antiviral Chem & Chemother. 12: 293-300; Knaggs et al., 2000 Bioorganic & Med. Chem. Letters 10: 2075-2078) each of which is incorporated in their entirety herein by reference.

The invention relates to the ability of the α-methylene-γ-butyrolactone moiety in sesquiterpene lactones to be structurally modified by, for example, Michael addition with amines or thiols. Modification of the parthenolide (1) molecule by this methodology using primary and/or secondary amines to form water-soluble amino derivatives, affords amine adducts that can easily be obtained as different inorganic or organic salts to further increase water solubility. Thus, a novel class of more water-soluble parthenolide analogs is described. When compounds in this class were evaluated for antileukemic activity, it was found that these compounds were either equipotent as, or more potent than the parent compound, parthenolide. More importantly, these novel analogs showed greater cytotoxicity towards leukemia cells than towards normal cells. Thus, the present invention provides a new class of parthenolide derivatives with potent and selective anticancer activities.

In accordance with the present invention, there are provided compounds of formula (I):

![Chemical Structure](image)

wherein:
- X1, X2 and X3 are heteroatoms; R4, R5, R6, R7, R8, R9 and R10 are independently selected from H, halo, 40H, 4CH2CH2OH and 4CH2NH2. Further preferred embodiments include compounds where R5, R6, R7, R9 and R10 are each H.
- R5, R6, R7, R9 and R10 are independently selected from H, halo, —OH, —NO2, —CN, —CH3, —CF3, —CH2CH3, —CH2F, —CH2Cl, —CH2OH, —CH2CH2OH and —CH2NH2. Further preferred embodiments include compounds where R5, R6, R7, R9 and R10 are each H.

Other preferred embodiments of the present invention include compounds where R₄ and R₈ are independently selected from optionally substituted C₂-C₄ alkyl. In one preferred embodiment, R₄ is —CH₃, and in another, R₄ and R₈ are each —CH₃.

In one embodiment, X₁, X₂, and X₃ are heteroatoms independently selected from O, N, and S, and in one particular embodiment, X₁, X₂, and X₃ are each O.

According to one embodiment, it is preferred that where R₄, R₅, R₆, R₇, and R₈ are each H; R₉ and R₄ are each —CH₃, and X₁, X₂, and X₃ are each O; Z is not —CH₃.

According to a further embodiment of the invention, Z is

$$(CH₂)ₙ-\text{NR} \quad R^2$$

where n is an integer from 0 to 4, where preferably, R₄, R₅, R₆, R₇, R₈, and R₉₀ are H; and R₉ and R₄ are each —CH₃.

In one particular embodiment, m is 1. In other embodiments, R¹ and R² are independently selected from hydrogen, —CN or optionally substituted C₂-C₄ alkyl. In particular embodiments, R¹ and R² are independently selected from —NO₂, —CN, —CF₃, —CH₂CN, —CH₂Cl, —CH₂OH, —CH₂COH and —CH₂NH₂.

In yet another embodiment, R¹ and R² together with N form an optionally substituted ring. The ring is a monocyclic, bicyclic or tricyclic aliphatic or aryl ring system, where the ring system is optionally substituted and optionally comprises one or more heteroatoms or a group selected from —CO₂H, —SO₂, —PO₂H, —NO₂, —OR, —SR, —SO₂— and —PO—; m is an integer from 0 to 5; and together with N form an optionally substituted ring, which may be additionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, where the system is optionally substituted and optionally comprises one or more heteroatoms. Alternatively, R₄ and R₅ are —(CH₂)ₙ—Y—(CH₂)ₙ—, where Y is a heteroatom or a group selected from —CO₂—, —SO₂—, —PO₂— and —OR—; n is an integer from 0 to 5; and together with N form an optionally substituted ring, the ring being optionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, where the system is optionally substituted and optionally comprise one or more heteroatoms.

Examples of ring systems include an optionally substituted urea ring or a derivative thereof. Other examples include optionally substitute pyrrole, imidazole, pyridine and pyrazole and derivative thereof. Examples of fused ring systems include optionally substituted aziridine-1-yl, azetidine-1-yl, pyrrolidine-1-yl, piperidine-1-yl, homopiperidine-1-yl and heptamethylenamine-1-yl.

According to a further embodiment of the invention, Z is

$$(CH₂)ₙ-S(O)₂H \quad R^1$$

where m is an integer from 0 to 4, n is an integer from 0 to 2, where preferably, R₄, R₅, R₆, R₇, R₈, and R₉₀ are H; and R₉ and R₄ are each —CH₃.

In one particular embodiment, m is 1. In another embodiment, n is 0. In other embodiments, R¹ is independently selected from hydrogen, —CN, optionally substituted C₂-C₄ alkyl or aryl. In particular embodiments, R¹ is selected from —C₆H₅, —CH₂(CH₂OH)(NH₂), and —CH₂COH.

Exemplary compounds of the present invention include:

11S,11,13-Dihydro, 13-dimethylaminoparthenolide (DMAP-PT)

11S,11,13-Dihydro, 13-diethylaminoparthenolide:

11S,11,13-Dihydro, 13-diethylaminoparthenolide (PPT)

11S,11,13-Dihydro, 13-(pyrrolidin-1-yl)parthenolide:

11S,11,13-Dihydro, 13-(piperidin-1-yl)parthenolide (PPT)

11S,11,13-Dihydro, 13-(morpholin-1-yl)parthenolide:

11S,11,13-Dihydro, 13-(4-methylpiperidin-1-yl)parthenolide (4MPEPT)

11S,11,13-Dihydro, 13-(4-methylpiperazin-1-yl)parthenolide:

11S,11,13-Dihydro, 13-(homopiperidin-1-yl)parthenolide;

11S,11,13-Dihydro, 13-(heptamethylenemin-1-yl)parthenolide;

11S,11,13-Dihydro, 13-(azetidin-1-yl)parthenolide;

11S,11,13-Dihydro, 13-methylbutyl aminoparthenolide;

11S,11,13-Dihydro, 13-methyl pentyl aminoparthenolide;

11S,11,13-Dihydro, 13-ethylaminoparthenolide;

11S,11,13-Dihydro, 13-methylaminoparthenolide;

11S,11,13-Dihydro, 13-cyclopropylaminoparthenolide;

11S,11,13-Dihydro, 13-propargylaminoparthenolide;

11S,11,13-Dihydro, 13-(N-benzyl-N-ethylamino)parthenolide;

11S,11,13-Dihydro, 13-(N-prolyl)parthenolide;

11S,11,13-Dihydro, 13-(S-thienophenyl)parthenolide;

11S,11,13-Dihydro, 13-(N,N-dietanolamine)parthenolide;

11S,11,13-Dihydro, 13-(thiomorpholin-4-yl)parthenolide;

11S,11,13-Dihydro, 13-(4-hydroxyxypiperidin-1-yl)parthenolide;

11S,11,13-Dihydro, 13-(1-methylhomopiperizin-4-yl)parthenolide;

11S,11,13-Dihydro, 13-(S-mercaptocacetyl)parthenolide;

11S,11,13-Dihydro, 13-(4-(2'-hydroxyethyl)piperidin-1-yl)parthenolide;

11S,11,13-Dihydro, 13-(piperazin-1-yl-4-carboxaldehyde)parthenolide;

11S,11,13-Dihydro, 13-(4-benzyl)piperidin-1-yl)parthenolide;

11S,11,13-Dihydro, 13-(piperidin-1-yl-4-carboxylic acid)parthenolide;

11S,11,13-Dihydro, 13-(azetidin-1-yl-3-carboxylic acid)parthenolide;

11S,11,13-Dihydro, 13-(S-cysteinyl)parthenolide;

11S,11,13-Dihydro, 13-(4-(piperidin-1-yl)piperidin-1-yl))parthenolide; and

Those of skill in the art will recognize that the invention comprises compounds that may contain one or more chiral centers on, for example, the parthenolide C-11 and thus can exist as racemic mixtures as pure diastereomers, or as pure enantiomers. For many applications, it is preferred to carry out stereoselective synthesis and/or to subject the reaction product to appropriate purification steps so as to produce substantially stereochirally pure or optically pure materials. Suitable stereoselective synthetic procedures for producing stereochirally pure or optically pure materials are well known in the art, as are procedures for resolving racemic mixtures into their optically pure enantiomers.

The present invention further provides for compounds having formula (I), or a pharmaceutically acceptable salt thereof, wherein Z is a group that is converted to —CH₃ under physiological conditions during or after administration to a mammalian patient, thereby yielding a methylene group. In particular embodiments, X₃, X₆, and X₉ are O; R₉, Rₖ, R₈, R₉₀, and R₉₀ are H; and R₉ and R₄ are each —CH₃. In one particular embodiment, m is 1. In another embodiment, n is 0. In other embodiments, R¹ is independently selected from hydrogen, —CN, optionally substituted C₂-C₄ alkyl or aryl. In particular embodiments, R¹ is selected from —C₆H₅, —CH₂(CH₂OH)(NH₂), and —CH₂COH.

Exemplary compounds of the present invention include:

11S,11,13-Dihydro, 13-dimethylaminoparthenolide (DMAP-PT)

11S,11,13-Dihydro, 13-diethylaminoparthenolide

11S,11,13-Dihydro, 13-diethylaminoparthenolide (PPT)

11S,11,13-Dihydro, 13-(pyrrolidin-1-yl)parthenolide

11S,11,13-Dihydro, 13-(piperidin-1-yl)parthenolide (PPT)

11S,11,13-Dihydro, 13-(morpholin-1-yl)parthenolide

11S,11,13-Dihydro, 13-(4-methylpiperidin-1-yl)parthenolide (4MPEPT)

11S,11,13-Dihydro, 13-(4-methylpiperazin-1-yl)parthenolide

11S,11,13-Dihydro, 13-(homopiperidin-1-yl)parthenolide;
The present invention further provides compounds having formula (I), or a pharmaceutically acceptable salt thereof, wherein Z is CH₂N(CH₃)₂ which under physiological conditions during or after administration to a mammalian patient, undergoes mono- or di-demethylation conversion to —CH₂-, or cysteine or protein conjugation. In particular embodiments, X₁, X₂ and X₃ are O; R₆, R₇, R₈, and R₁₀ are H; R₄ and R₅ are —CH₃.

The present invention further provides compounds wherein the parthenolide based derivatives of formula (I) form dimers or duplexes with another molecule of formula (I) or with basic nitrogen-containing synergistic anticancer drug molecules such as 5-fluorouracil, cytarabine, mytomycin C, Doxorubicin and Daunorubicin. Accordingly, the present invention provides compounds of the general formula (II):

where L is a linker, as defined above, and W is a molecule with anti-cancer growth activity. Where W is another parthenolide derivative of formula (I), the present invention provides compounds of formula (III):

In the above scheme, the solvent is selected from a low alkyl alcohol, such as methanol, ethanol, propanol, isopropanol, n-butanol, tert-butanol, and chloroform, methylene chloride, benzene, toluene, tetrahydrofuran, dioxane, 1,2-dimethoxylethane, pyridine, carbon tetrachloride, diethyl ether, tert-butyl methyl ether and/or the mixture of two or more of the solvents listed above. The base is selected from a low trialkylamine, such as trimethylamine, triethylamine, triproplylamine, and tributylamine, and pyridine, 2-,-3-, and 4-picolines, 2-, 3-, and 4-dimethylaminopyridines. The temperature is selected from -20°C. to 130°C. The reaction time required to effect the desired coupling reaction can vary widely, typically falling in the range of 30 min to 24 hours. Purification can be achieved by a variety of techniques, such as liquid chromatography through neutral or basic silica gel, bonded silica gel phases such as octadecylsilica, octylsilica
and the like, cellulose or alumina with the solvent such as, for example, the mixture of chloroform and methanol or ethanol, the mixture of methylene chloride and methanol or ethanol, the mixture of hexane and acetone or acetonitrile or methanol or ethanol or isopropanol, the mixture of diethyl ether and acetone or acetonitrile or methanol or ethanol or isopropanol; and recrystallization using normal organic solvent or solvent mixture, such as methanol, ethanol, propanol, isopropanol, tert-butanol, acetonitrile, diethyl ether, chloroform, methylene chloride and the mixture of two or more solvents listed above. The purity of the invention compounds prepared is assessed by mass spectrometry, nuclear magnetic resonance spectrometry (NMR) and elemental combustion analysis.

Furthermore, in accordance with still another embodiment of the present invention, the methods for the preparation of the invention salts are disclosed in Schemes III and IV.

**Scheme III**

![Scheme III Diagram](image)

In these schemes, HX is selected from hydrochloride, hydrobromide, hydriodicide, perchlorate, sulfate, hemisulfate, mesylate, toluenesulfonate, benzenesulfonate, succinate, hemisuccinate, fumarate, tartarate, ascorbate, acetate, hemifumarate, maleate, citrate, oxalate, malonate, malic, propionate and benzoate; Y is selected from halide (fluoride, chloride, bromide, iodide), methylsulfonate, toluenesulfonate, benzenesulfonate and sulfate; and the solvent is selected from a low alkyl alcohol, such as diethyl ether, methanol, ethanol, propanol, isopropanol, n-butanol, tert-butanol, and chloroform, methylene chloride, benzene, toluene, tetrahydrofurane, dioxane, 1,2-dimethoxyethane, pyridine, carbon tetrachloride, tert-butyl methyl ether, acetone and/or the mixture of two or more of the solvents listed above. The temperature is selected from -20°C to 50°C. Purification can be achieved by recrystallization using normal organic solvent or solvent mixture, such as methanol, ethanol, acetone, propanol, isopropanol, t-butanol, acetonitrile, diethyl ether, chloroform, methylene chloride and the mixture of two or more solvents listed above.

**Scheme IV**

![Scheme IV Diagram](image)

**DUPLEX ANALOG** 

In these schemes, HX is selected from hydrochloride, hydrobromide, hydriodicide, perchlorate, sulfate, hemisulfate, mesylate, toluenesulfonate, benzenesulfonate, succinate, hemisuccinate, fumarate, tartarate, ascorbate, acetate, hemifumarate, maleate, citrate, oxalate, malonate, malic, propionate and benzoate; Y is selected from halide (fluoride, chloride, bromide, iodide), methylsulfonate, toluenesulfonate, benzenesulfonate and sulfate; and the solvent is selected from a low alkyl alcohol, such as diethyl ether, methanol, ethanol, propanol, isopropanol, n-butanol, tert-butanol, and chloroform, methylene chloride, benzene, toluene, tetrahydrofurane, dioxane, 1,2-dimethoxyethane, pyridine, carbon tetrachloride, tert-butyl methyl ether, acetone and/or the mixture of two or more of the solvents listed above. The temperature is selected from -20°C to 50°C. Purification can be achieved by recrystallization using normal organic solvent or solvent mixture, such as methanol, ethanol, acetone, propanol, isopropanol, t-butanol, acetonitrile, diethyl ether, chloroform, methylene chloride and the mixture of two or more solvents listed above.
The present invention further provides analogues of compounds of formula (I). Examples are described below and include costunolide, dehydroadcostuslactone, alantolactone, isovalantolactone, amino-3-oxo-isovalantolactone, helenalin, 11,13-dihydrohelenalin, aminocyanaropicrin, aminodesacylcyanaropicrin, (+)-aminoreynosin, aminosantammarin, aminosoulangianolide and aminoisotelekin. In addition, the present invention provides compounds of the analogues below, amino-3-oxo-isovalantolactone, aminocyanaropicrin, aminodesacylcyanaropicrin, (+)-aminoreynosin, aminosantammarin, aminosoulangianolide and aminoisotelekin wherein (—CH₂—NR₁R₂) is replaced by Z, where Z is as defined herein.

Dehydroadcostuslactone

Alantolactone

Helenalin

Isovalantolactone

Costunolide

11,13-Dihydrohelenalin

Aminocyanaropicrins

Aminodesacylcyanaropicrins

(+)-Aminoreynosins

Aminosantammarins
The invention relates to the ability of the \( \alpha \)-methylene-\( \gamma \)-butyrolactone moiety in all the above-mentioned sesquiterpene lactones to be structurally modified by, for example, Michael addition with the following chemical entities to form more water-soluble derivatives than the corresponding parent sesquiterpene, and with improved properties conducive for drug development, such as, chemical stability, reduced toxicity and oral bioavailability.

The present invention further provides compounds of the parthenolide-analog dehydrocostuslactone based derivatives of formula (IV):

Presently preferred compounds include compounds of formula (IV) wherein \( R_3, R_4, R_5, R_6, R_7, R_8, R_9, R_{10} \) and \( R_{11} \) are independently selected from \( H, \text{halo}, -\text{OH}, -\text{NO}_2, -\text{CN}, -\text{CH}_3, -\text{CF}_3, -\text{CH}_2\text{CF}_3, -\text{CH}_2\text{Cl}, -\text{CH}_2\text{OH}, -\text{CH}_2\text{CH}_2\text{OH} \) and \( -\text{CH}_2\text{NH}_2 \). Further preferred embodiments include compounds wherein \( R_3, R_5, R_6, R_7 \) and \( R_{10} \) are each \( H \).

Other preferred embodiments of the present invention include compounds wherein \( R_4 \) and \( R_9 \) are independently selected from optionally substituted \( \text{C}_1-\text{C}_4 \text{ alkyl} \). In one preferred embodiment, \( R_4 \) and \( R_9 \) are each \( -\text{CH}_2\text{H}_2 \).

In one embodiment, \( X_1 \) and \( X_2 \) are heteroatoms independently selected from \( O, N \) and \( S \), and in one particular embodiment, \( X_1 \) and \( X_2 \) are each \( O \).

According to a further embodiment, \( \text{R}^1 \) and \( \text{R}^2 \) together with \( N \) form an optionally substituted ring. The ring is a monocyclic, bicyclic or tricyclic aliphatic or aryl ring system, where the ring system is optionally substituted and optionally comprises one or more heteroatoms or a group selected from \( -\text{CO}-, -\text{SO}-, -\text{SO}_2- \) and \( -\text{PO}- \). In one particular embodiment, \( \text{R}^1 \) and \( \text{R}^2 \) are \( -\text{CH}_2\text{H}_2\text{H}_2\text{Y} \), where \( Y \) is a heteroatom or a group selected from \( -\text{CO}-, -\text{SO}-, -\text{SO}_2- \) and \( -\text{PO}- \); \( a \) is an integer \( 0 \) to \( 5 \); and together with \( N \) form an optionally substituted ring, which may be additionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, where the system is optionally substituted and optionally comprises one or more heteroatoms. Alternatively, \( \text{R}_3 \) and \( \text{R}_2 \) are \( -\text{CH}_2\text{H}_2-\text{Y}-\text{CH}_2\text{H}_2 \), where \( Y \) is a heteroatom or a group selected from \( -\text{CO}-, -\text{SO}-, -\text{SO}_2- \) and \( -\text{PO}- \); \( a \) is an integer \( 0 \) to \( 5 \); \( b \) is an integer \( 0 \) to \( 5 \); and together with \( N \) form an optionally substituted ring, the ring being optionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, where the system is optionally substituted and optionally comprise one or more heteroatoms.

Examples of ring systems include an optionally substituted urea ring or a derivative thereof. Other examples include optionally substitute pyrrole, imidazole, purine and pyrazole and derivative thereof. Examples of fused ring systems include optionally substituted aziridine-1-yl, azetidine-1-yl, pyrrolidin-1-yl, piperidin-1-yl, homopiperidin-1-yl and heteroalkylenimin-1-yl.

With respect to formulas (I) and (IV), in other embodiments, \( Z \) is hydroxyamine, a hydroxyalkylamino compound, a thioalkylamino compound, a diaminoalkane. Examples include ethylenediamine, piperazine, triaminolkanes, polyamines, polylysine, putrescine, spermine, spermidine, aminoguanidines and agmatine. In other embodiments, \( Z \) is an amino acid. For example glycine, serine, hydroxyproline, \( \beta \)-alanine, cysteine, homocysteine, arginine, lysine, glutamic acid, ornithine, aspartic acid, \( \gamma \)-aminobutyric acid, or tyrosine.

In other embodiments, \( Z \) is an amino sugar; for example glucosamine. In other embodiments, \( Z \) is a polyoxyethylene glycol of various molecular weights, each of which terminate in an amino functionality that will form an adduct with the appropriate sesquiterpene.

Modification of the sesquiterpene molecules by these methodologies, affords adducts that can easily be obtained as different inorganic or organic salts to further increase water solubility.

The compounds described herein are useful for treating cancer. Cancers treatable by the present therapy include the solid and hematological tumors, such as prostate cancer, ovarian cancer, breast cancer, brain cancer and hepatic cancer, comprising administering to a mammal afflicted with said cancer an amount of parthenolide derivative effective to inhibit the viability of cancer cells of said mammal. The parthenolide derivative may be administered as primary therapy, or as adjunct therapy, either following local intervention (surgery, radiation, local chemotherapy) or in conjunc-
tion with at least one other chemotherapeutic agent discussed hereby above, as well as the solid tumors disclosed in U.S. Pat. No. 5,514,555. Hematological cancers, such as the leukemias are disclosed in the Mayo Clinic Family Health Book, D. E. Larson, ed., William Morrow, N.Y. (1990) and include C.L., A.L., CML, and the like. Compounds of the present invention may be used in bone marrow transplant procedure to treat bone marrow prior to reintroduction to the patient. In addition, the compounds of the present invention may be used as chemotherapy sensitizers or radiation therapy sensitizers. Accordingly, a patient, or cells, or tissues, derived from a cancer patient, are pre-treated with the compounds prior to standard chemotherapy or radiation therapy. The present invention contemplates that parthenolide may also be used in such methods.

Within another aspect of the present invention, methods are provided for inhibiting angiogenesis in patients with non-tumorogenic, angiogenesis-dependent diseases, comprising administering a therapeutically effective amount of a composition comprising parthenolide derivative to a patient with a non-tumorogenic angiogenesis-dependent disease, such that the formation of new blood vessels is inhibited. Within other aspects, methods are provided for inhibit reactive proliferation of endothelial cells or capillary formation in non-tumorogenic, angiogenesis-dependent diseases, such that the blood vessel is effectively occluded. Within one embodiment, the anti-angiogenic composition comprising parthenolide derivative is delivered to a blood vessel which is actively proliferating and nourishing a tumor.

In addition to tumors, numerous other non-tumorogenic angiogenesis-dependent diseases, which are characterized by the abnormal growth of blood vessels, may also be treated with the anti-angiogenic parthenolide derivative compositions, or anti-angiogenic factors of the present invention. Anti-angiogenic parthenolide derivative compositions of the present invention can block the stimulatory effects of angiogenesis promoters, reducing endothelial cell division, decreasing endothelial cell migration, and impairing the activity of the proteolytic enzymes secreted by the endothelium. Representative examples of such non-tumorogenic angiogenesis-dependent diseases include cornal neovascularization, hypertrophic scars and keloids, proliferative diabetic retinopathy, arteriovenous malformations, atherosclerotic plaques, delayed wound healing, hemorrhagic joints, nonunion fractures, Osler-Weber syndrome, psoriasis, pyogenic granuloma, scleroderma, trachoma, menorrhagia, retrolental fibroplasia and vascular adhesions. The pathology and treatment of these conditions is disclosed in detail in published PCT application PCT/CA94/00373 (WO 95/03036), at pages 26-36. Topical or directed local administration of the present compositions is often the preferred mode of administration of therapeutically effective amounts of parthenolide derivative, i.e., in depot or other controlled release forms.

Anti-angiogenic compositions of the present invention may also be utilized in a variety of other manners. For example, they may be incorporated into surgical sutures in order to prevent stitch granulomas, implanted in the uterus (in the same manner as an IUD) for the treatment of menorrhagia or as a form of female birth control, administered as either a peritoneal lavage fluid or for peritoneal implantation in the treatment of endometriosis, attached to a monoclonal antibody directed against activated endothelial cells as a form of systemic chemotherapy, or utilized in diagnostic imaging when attached to a radioactively labelled monoclonal antibody which recognizes active endothelial cells. The magnitude of a prophylactic or therapeutic dose of parthenolide derivative, an analog thereof or a combination thereof, in the acute or chronic management of cancer, i.e., prostate or breast cancer, will vary with the stage of the cancer, such as the solid tumor to be treated, the chemotherapeutic agent(s) or other anti-cancer therapy used, and the route of administration. The dose, and perhaps the dose frequency, will also vary according to the age, body weight, and response of the individual patient. In general, the total daily dose range for parthenolide derivative and its analogs, for the conditions described herein, is from about 0.5 mg to about 2500 mg, in single or divided doses. Preferably, a daily dose range should be about 1 mg to about 100 mg, in single or divided doses, most preferably about 5-50 mg per day. In managing the patient, the therapy should be initiated at a lower dose and increased depending on the patient’s global response. It is further recommended that infants, children, patients over 65 years, and those with impaired renal or hepatic function initially receive lower doses, and that they be titrated based on global response and blood level. It may be necessary to use dosages outside these ranges in some cases. Further, it is noted that the clinician or treating physician will know how and when to interrupt, adjust or terminate therapy in conjunction with individual patient response. The terms “an effective amount” or “an effective sensitizing amount” are encompassed by the above-described dosage amounts and dose frequency schedule.

Any suitable route of administration may be employed for providing the patient with an effective dosage of parthenolide derivative (e.g., oral, sublingual, rectal, intravenous, epidural, intrathecal, subcutaneous, transcutaneous, intramuscular, intraperitoneal, intracutaneous, inhalation, transdermal, nasal spray, nasal gel or drop, and the like). While it is possible that, for use in therapy, parthenolide derivative or its analogs may be administered as the pure chemicals, as by inhalation of a fine powder via an insufflator, it is preferable to present the active ingredient as a pharmaceutical formulation. The invention thus further provides a pharmaceutical formulation comprising parthenolide derivative or an analog thereof, together with one or more pharmaceutically acceptable carriers therefor and, optionally, other therapeutic and/or prophylactic ingredients. The carrier(s) must be ‘acceptable’ in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof, such as a human patient or domestic animal.

Pharmaceutical formulations include those suitable for oral or parenteral (including intramuscular, subcutaneous and intravenous) administration. Forms suitable for parenteral administration also include forms suitable for administration by inhalation or insufflation or for nasal, or topical (including buccal, rectal, vaginal and sublingual) administration. The formulations may, where appropriate, be conveniently presented in discrete unit dosage forms and may be prepared by any of the methods well known in the art of pharmacy. Such methods include the step of bringing into association the active compound with liquid carriers, solid matrices, semisolid carriers, finely divided solid carriers or combinations thereof, and then, if necessary, shaping the product into the desired delivery system.

Pharmaceutical formulations suitable for oral administration may be presented as discrete unit dosage forms such as hard or soft gelatin capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or as granules; as a solution, a suspension or as an emulsion; or in a chewable base such as a synthetic resin or chicle for ingestion of the agent from a chewing gum. The active ingredient may also be presented as a bolus, electuary or paste. Tablets and capsules for oral administration may contain conventional excipients such as binding agents, ill-
ers, lubricants, disintegrants, or wetting agents. The tablets may be coated according to methods well known in the art, i.e., with enteric coatings.

Oral liquid preparations may be in the form of, for example, aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, or may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), or preservatives.

The compounds according to the invention may also be formulated for parenteral administration (e.g., by injection, for example, bolus injection or continuous infusion) and may be presented in unit dose form in ampoules, pre-filled syringes, small volume infusion containers or in multi-dose containers with an added preservative. The compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient may be in powder form, obtained by aseptic isolation of sterile solid or by lyophilization from solution, for constitution with a suitable vehicle, e.g., sterile, pyrogen-free water, before use.

For topical administration to the epidermis, the compounds may be formulated as ointments, creams or lotions, or as the active ingredient of a transdermal patch. Suitable transdermal delivery systems are disclosed, for example, in A. Fisher et al. (U.S. Pat. No. 4,788,603), or R. Bawa et al. (U.S. Pat. Nos. 4,931,279; 4,668,506 and 4,713,224). Ointments or creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Lotions may be formulated with an aqueous or oily base and in general also contain one or more emulsifying agents, stabilizing agents, dispersing agents, suspending agents, thickening agents, or coloring agents.

Formulations suitable for topical administration in the mouth include unit dosage forms such as lozenges comprising active ingredient in a flavored base, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert base such as gelatin and glycerin or sucrose and acacia; mucoadhesive gels, and mouthwashes comprising the active ingredient in a suitable liquid carrier.

When desired, the above-described formulations can be adapted to provide sustained release of the active ingredient employed, e.g., by combination with certain hydrophilic polymer matrices, e.g., comprising natural gels, synthetic polymer gels or mixtures thereof. The polymer matrix can be coated onto, or used to form, a medical prosthesis, such as a stent, valve, shunt, graft, or the like.

Pharmaceutical formulations suitable for rectal administration wherein the carrier is a solid are more preferably presented as unit dose suppositories. Suitable carriers include cocoa butter and other materials commonly used in the art, and the suppositories may be conveniently formed by admixture of the active compound with the softened or melted carrier(s) followed by chilling and shaping in molds.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or sprays containing, in addition to the active ingredient, such carriers as are known in the art to be appropriate.

For administration by inhalation, the compounds according to the invention are conveniently delivered from an insufflator, nebulizer or a pressurized pack or other convenient means of delivering an aerosol spray. Pressurized packs may comprise a suitable propellant such as dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount.

Alternatively, for administration by inhalation or insufflation, the compounds according to the invention may take the form of a dry powder composition, for example, a powder mix of the compound and a suitable powder base such as lactose or starch. The powder composition may be presented in unit dosage form in, for example, capsules or cartridges or, e.g., gelatin or blister packs from which the powder may be administered with the aid of an inhalator or insufflator.

For intra-nasal administration, the compounds of the invention may be administered via a liquid spray, such as via a plastic bottle atomizer. Typical of these are the Mistometer™ (Wintrop) and the Medihaler™ (Rikter). For topical administration to the eye, the compounds can be administered as drops, gels (U.S. Pat. No. 4,255,415), gums (see U.S. Pat. No. 4,136,177) or via a prolonged-release ocular insert.

The invention will now be described in greater detail by reference to the following non-limiting examples.

EXAMPLES

Example 1

General Synthetic Procedure for the Preparation of 11S,11,13-Dihydro-13-Substituted Aminoparthenolides

A mixture of parthenolide (Sigma P 0667, 100 mg, 0.4 mmol), the appropriate primary amine or secondary amine (2 mmol), and triethylamine (1 to 2 mL) in 30 mL of anhydrous ethanol was stirred at a specific temperature ranging from ambient temperature to the temperature of the refluxing solvent utilized, or was left to stand in the refrigerator (−20°C to 4°C) overnight for 24 hours. Ethanol, triethylamine and/or the appropriate volatile amine were then evaporated under vacuum in a rotary evaporator. The resulting residue was subjected to silica gel column chromatographic purification using chloroform-methanol or methylene chloride-methanol mixed solvent as the mobile phase. NMR (Varian, 300 MHz and 400 MHz) and GC/MS (Agilent, 6890GC and 5973MSD) analysis methodologies were utilized to assure the identity and purity of the synthetic compounds.

Example 2

11S,11,13-Dihydro-13-dimethylaminoparthenolide (DAMPT)

Parthenolide (100 mg, 0.4 mmol), dimethylamine (2M in methanol, 1 mL), triethylamine (2 mL), ethanol (30 mL) were refluxed overnight. After column purification, 109 mg of pale yellow 11S,11,13-dihydro-13-dimethylaminoparthenolide was obtained (Yield: 93%). Melting point: 143-144°C. 1H-NMR (300 MHz, CDCl3): δ 5.22 (1H, d), 3.85 (1H, t), 2.75 (2H, m), 2.65 (1H, dd), 2.5-2.3 (3H, s), 2.25 (6H, s), 2.5-2.0 (5H, m), 1.7 (3H, s), 1.3 (3H, s), 1.3-1.15 (1H, m).

13C-NMR (300 MHz, CDCl3): δ 176.1, 134.4, 124.8, 81.9, 66.4, 61.3, 57.6, 47.8, 46.4, 46.1, 41.0, 36.6, 29.9, 24.0, 17.2, 16.9. Mass Spec (GC/MS): 293 (M+) Retention time: 12.56 minutes. Ultra-violet (Methanol): λmax at 214 nm. Infra-Red (Nujol): 1757.9, 1460, 1377 cm⁻¹. X-ray crystallographic analysis using a Nonius KappaCCD diffractometer DAMPT (11S,11,13-dihydro, 13-dimethylaminoparthenolide) has the S-configuration at C-11.
Example 3

11S,11,13-Dihydro,13-diethylaminoparthenolide

Parthenolide (100 mg, 0.4 mmol), diethylamine (200 mg, 2.7 mmol), triethylamine (2 mL), ethanol (30 mL) were refluxed overnight. After column purification, 114 mg of yellow 11S,11,13-dihydro,13-diethylaminoparthenolide was obtained (Yield: 88%).

Example 4

Preparation of Salts of 11S,11,13-Dihydro,13-aminoparthenolide Derivatives

The aminoparthenolide derivative was dissolved in anhydrous ether and to this solution was added the corresponding acid in ether or ethanol. The mixture was kept in the refrigerator (4°C) overnight. The crystals formed was filtered and dried under vacuum, or submitted to further recrystallization, if needed.

Example 5

Preparation of 11S,11,13-dihydro,13-(piperidin-1-yl)parthenolide hydrochloride

11S,11,13-dihydro,13-(piperidin-1-yl)parthenolide (5 mg) was dissolved in 2 mL of dry ether. Hydrochloride in ether (1M, 0.015 mL) was added to the ether solution until the solution became cloudy; then more ether was added and the mixture was heated to obtain a clear solution. The mixture was left in refrigerator (4°C) for more than 24 hours. The white crystals that formed were filtered through filter paper, and dried under vacuum overnight (Yield: 18%).

Example 6

Preparation of 11S,11,13-dihydro,13-dimethylaminoparthenolide maleate

To 11S,11,13-dihydro,13-dimethylaminoparthenolide (30 mg, 0.1 mmol) in anhydrous ethanol (5 mL) was added maleic acid (12 mg, 0.1 mmol) in 3 mL of anhydrous ethanol. The solution was shaken well and filtered through a regular filter paper. The clear solution was left in the refrigerator for a week. The white crystals formed were obtained by filtration, dried in a desiccator under vacuum with anhydrous CaCl₂ (Yield: 55%).

Example 7

Preparation of 11S,11,13-dihydro,13-Dimethylaminoparthenolide methiodide

To 11S,11,13-dihydro,13-dimethylaminoparthenolide (30 mg, 0.1 mmol) in anhydrous methanol (5 mL) was added iodomethane (90 mg, 0.6 mmol) in methanol (1 mL). The clear solution was shaken and stored at room temperature. After three days, the methanol was evaporated, the pale yellow residue was dried in a desiccator under vacuum, over anhydrous CaCl₂. Recrystallization from acetone-ether afforded pale yellow crystals (Yield: 86%).

Example 8

11S,11,13-dihydro,13-(4-Methylpiperidin-1-yl)parthenolide methiodide

To 11S,11,13-dihydro,13-(4-methylpiperidin-1-yl)parthenolide (35 mg, 0.1 mmol) in anhydrous methanol (5 mL) was added iodomethane (90 mg, 0.6 mmol) in methanol (1 mL). The clear solution was shaken and stored at room temperature. After three days, the methanol was evaporated, the pale yellow residue was dried in a desiccator under vacuum, over anhydrous CaCl₂. Recrystallization from acetone-ether afforded pale yellow crystals (Yield: 79%).

Example 9

Assay for Antileukemic Activity

For apoptosis analysis, one million primary acute myelogenous leukemia (AML) cells were washed with cold PBS and resuspended in 200 microliters of Annexin binding buffer (10 mM HEPES/NaOH pH 7.4; 140 mM NaCl; 2.5 mM CaCl₂). Annexin V-FITC (Pharminagen) and 0.25 mg/mL 7-AAD (7-aminoactinomycin D, Molecular Probes, CA) were added and the tubes were incubated at room temperature in the dark for 15 minutes. Cells were then diluted with 200 microliters of Annexin binding buffer and analyzed immediately by flow cytometry. Viable cells were identified as failing to label with Annexin V or 7-AAD. Cells beginning to die label with Annexin V, and as membrane integrity is lost, will also label with 7-AAD. For each parthenolide derivative, the percentage of viable cells was determined after 24 hours of culture at a 10 micromolar concentration. Data are normalized to untreated control specimens. The data are in Table 1 for aminoparthenolide derivatives and Table 2 for the salts of some aminoparthenolides.

Healthy human bone marrow cells were used in the above assay to test the cytotoxicity of parthenolide. Eighty-five percent of the normal cells survived 10 μM of parthenolide. All the aminoparthenolides evaluated afforded results similar to parthenolide, i.e. the survival rate of healthy human bone marrow cells was over 85% at a concentration of 10 μM.

**Example 10**

**Analysis of Parthenolide and Dimethylaminoparthenolide (DMAPT) Using Human-Mouse Xenografts**

To assess the effect of parthenolide on primary human stem cell populations, experiments were conducted using transplantation into immune deficient NOD/SCID mice. Successful engraftment of NOD/SCID bone marrow at 6-8 weeks post-transplant has been shown to be a measure of stem cell content for human hematopoietic cell populations (Lapidot et al., *J Mol. Med.* 1997; 75: 664-673; Dick, *Curr Opin Hematol.* 1996; 3:405-409). For each experiment, cryopreserved mononuclear cell specimens from normal or AML donors were thawed, and treated in vitro with 7.5 micromolar parthenolide for 12-18 hours. Following culture, 5-10 million cells/animal were injected intravenously into sublethally irradiated (300 Rad) NOD/SCID mice. After 6-8 weeks, animals were sacrificed and bone marrow was analyzed for the presence of human cells using flow cytometry as previously described (Guzman et al., *Proc Natl Acad Sci USA* 2002; 99: 16220-162253). Human specific antibodies for CD45 were used to assess the level of total engraftment.
In three independent experiments, the level of engraftment for parthenolide-treated AML cells was dramatically reduced, which indicates a direct effect on the AML stem cell compartment. In contrast, no reduction in engraftment was detected for parthenolide-treated normal specimens, thus showing the parthenolide does not target normal hematopoietic stem cells. Similarly, treatment of AML cells with 7.5 micromolar DMAPT also yielded a strong reduction in NOD/SCID engraftment while treatment of normal cells showed no significant effects.

Example 11

MTS-PMS Assay

A 96-well U-bottomed plate (Becton Dickinson Labware, Franklin Lakes, N.J.) at a concentration of 5,000 cells per 50 microliters (mL) of media was incubated in 5% CO2 at 37°C for 24 hours. Varying compound concentrations in 30 mL of media were added to the media 24 hours later. Colorimetric readings were obtained using the MTS-PMS system and an ELISA plate reader, after 48 hours of exposure to DMAPT. The readings obtained for each concentration tested were from an average of eight wells. Each experiment was expressed as a percentage of the solvent control and completed at least three times with consistent results. The results presented are an average of three experiments. The hormone refractory prostate cancer cell line CWR22Rv1 was treated with increasing concentrations of parthenolide and DMAPT, for three hours. Both parthenolide and DMAPT reduced cellular proliferation by 50% at 5 μM in the CWR22 MTS-PMS assay. Cellular proliferation was also measured in the MTS-PMS assay using four lung cancer cell lines treated with parthenolide and derivatives PIPT (11S,11,13-dihydro-13-(piperidin-1-yl)parthenolide), 4MEPT (11S,11,13-dihydro, 13-(4-methylpiperidin-1-yl)parthenolide) and MAPT (11S,11,13-dihydro, 13-dimethylaminoparthenolide). Parthenolide and its derivatives inhibited cellular proliferation in a dose dependent manner between 2 and 10 μM with 70% inhibition at 10 μM in AS49, 50% in H460, 40% in H-23 and 40% in H522 (FIGS. 2-5).

Example 12

Clonogenic Assay

Initially, 100 cells growing in log phase were plated per 3 mL of media in each well of a six well plate. After 24 hrs of plating of the cells the test compound was added at varying concentrations. At 24 and 96 hours after addition of drug, the media was changed. Hence, the cells were only exposed to the drug for 24 hrs. When cell colonies appeared at Day 15 they were stained by Sure Stain Dye and counted. The hormone refractory prostate cancer cell line CWR22Rv1 was treated with increasing concentrations of parthenolide derivatives DMAPT, PIPT and 4MEPT for three hours. Cellular proliferation was reduced by up to 80% at 2 μM in the clonogenic assay (FIG. 1). The breast cancer cell line clonogenic assay with hbl-100, mcl-31 and 436 cells showed almost complete inhibition of proliferation with DMAPT at 2 μM concentration in the clonogenic assay (FIGS. 6-8). Parthenolide also reduced proliferation with similar dosage ranges.

Example 13

cDNA Array Analysis

Total cellular RNA was extracted from the human monocye cell line THP-1 under three conditions 2 hours after Time 0.

#### Example 14

**Oral Bioavailability in Mice**

Preliminary in vivo work was conducted to determine the bioavailability and toxicity of this agent in mice. As shown in FIG. 4, it was demonstrated that whereas 40 mg/kg of oral parthenolide provided a plasma level of ∼0.2 mg/l after oral gavage of only ∼200 mg the same dose of DMAPT provided a plasma level of ∼5000 ng/ml (8 μM approximately 5 mice in each group). All of these results have been measured and the effect of DMAPT on survival of the mice was evaluated by LC-MS. Although the level of plasma concentration was low, the data showed that the mice gained weight and survived for 3 weeks of daily treatment with oral DMAPT at 40 mg/kg with no overt toxicities.

#### Example 15

**Electrophoretic Mobility Gel Shift Assay**

Each cancer cell line in exponential growth phase was treated with solvent control or various concentrations of parthenolide derivatives dissolved in 100% ethanol for 3 hours prior to harvesting. Cells were harvested and whole cell extracts were prepared as described previously (Nakshatri et al., Mol Cell Biol, 17: 3629-3639, 1997; Sweeney et al., Clin Cancer Res, 10: 5501-5507, 2004). Extracts were incubated with a radiolabeled NF-kB probe for 30 minutes at room temperature. The oligonucleotide probe binds to the NF-kB DNA binding site in the promoter region of the immunoglobulin gene. Electrophoresis and autoradiography were performed as described previously (Nakshatri et al., 1997) using NF-kB and SP-1 probes (Promega, Madison, Wis.). The specificity of parthenolide and derivative inhibition of NF-kB DNA binding was verified by the use of the SP-1 probe as a control. Identification of the NF-kB subunits binding to DNA and inhibited by DMAPT were identified by gel supershifting. Constitutive NF-kB DNA binding activity was determined in the lung cancer cell lines A-549, H-23, H-522, and H-460. All four non-small lung cancer cell lines were treated with increasing concentrations of DMAPT for three hours, and NF-kB DNA binding was measured by electrophoretic mobility shift assay (EMSA) as described. NF-kB DNA binding activity was highest in A-549 cells, followed by H-23, H-522 and H-460 cells. DMAPT between 2 and 10 micromolar substantially decreased NF-kB DNA binding activity in all lung cancer cell lines tested.

Cancer cell lines HT-1376 and UMUC-3 were treated with increasing concentrations of DMAPT for three hours. Whole cell extracts were prepared as described and DNA binding by NF-kB was analyzed by EMSA with NF-kB and OCT-1 (internal control) probes. DMAPT decreased NF-kB DNA binding in a dose-dependent manner with HT-1376 and UMUC-3 cell lines (FIG. 10).

The hormone refractory prostate cancer cell line, CWR22Rv1 was treated with increasing concentrations of DMAPT for three hours. Whole cell extracts were prepared as described and DNA binding by NF-kB was analyzed by EMSA with NF-kB and SP-1 (internal control) probes. DMAPT decreased NF-kB DNA binding in a dose dependent manner with substantial decreases of NF-kB DNA binding at 10 μM DMAPT.

EMSA results thus showed DMAPT decreased the constitutive NF-kB DNA binding in several cancer cell lines.

#### Example 16

**Pretreatment of Radiation Sensitive Cell Line A549**

The radiation sensitive cell line A549 was pretreated with parthenolide concentrations ranging from 0 to 2.5 micromolar. The cells were then subjected to ionizing radiation doses ranging from 0-6 Gy and survival fraction of the cells determined. Results demonstrated that parthenolide induced radiation sensitivity to the cells in a dose-dependent manner with survival fraction at 2.5 micromolar ranging from 10% at 2 Gy to less than 1% at 6 Gy. Cells not receiving pre-treatment with parthenolide had greater than 50% survival fraction at the highest radiation dose of 6 Gy and over 90% survival at 2 Gy.

#### Example 17

**TRAIL Induced Apoptosis Assay**

MDA-MB-231 breast cancer cells (2×10^5 cells in 60 mm plates) were treated first with 2 or 5 μM of DMAPT (LC-1). After two hours, TRAIL (TNF related-apoptosis-inducing ligand, 5 ng/ml) or TRAIL-R1 activating antibodies (10 ng/ml) were added. After 48 hours of TRAIL or TRAIL-R1 antibody treatment, cells were harvested and apoptosis was measured using carboxyfluorescein-FLICA assay. Briefly, both attached and floating cells were collected by trypsinization, incubated with carboxyfluorescein-labeled pan-caspase inhibitor FAM-FLICA for 2 h at 37°C. Labeled cells were rinsed twice in PBS and resuspended in 300 μl of PBS containing 0.3 μg of propidium iodide. Apoptotic cells were identified by FACScan analysis. Live cells do not stain (FIGS. 11 and 12). Lower left quadrant. FAM-FLICA stains apoptotic cells (upper left). Apoptotic cells that have lost plasma membrane integrity are stained by both FAM-FLICA and propidium iodide (upper right). Necrotic cells are stained only by propidium iodide (lower right). MDA-MB-231 cells are relatively resistant to TRAIL. However, they
became sensitive to TRAIL or TRAIL-RII activating antibody-induced apoptosis and atypical apoptosis upon pre-treatment with DMAPT.

We claim:

1. A method of inhibiting cancer cell growth, comprising administering to a mammal afflicted with cancer, an effective amount of a compound of formula (I):

   \[
   \text{R}^1 \text{ and } \text{R}^2 \text{ are independently selected from H, CN, and optionally substituted straight-chained or branched aliphatic optionally containing 1 or more double or triple bonds; wherein optional substituents are selected from one or more of } -\text{NH}_2, -\text{NH}-(\text{C}_1\text{-aliphatic}), \text{halogen, } -\text{OH}, -\text{OC}(\text{C}_1\text{-aliphatic}), -\text{NO}_2, -\text{CN}, -\text{CO}_2\text{H}, -\text{CO}_2(\text{C}_1\text{-aliphatic}), -\text{O}(\text{halo C}_1\text{-aliphatic}), \text{or } -\text{halo(C}_1\text{-aliphatic)};
   \]

   wherein each C₁₄ aliphatic is optionally substituted; and \( \text{R}^1 \) and \( \text{R}^2 \) are independently selected from cycloalkyl, heterocycloalkyl, aryl or heteroaryl; and provided that \( \text{R}^1 \) and \( \text{R}^2 \) are not simultaneously H; or where \( \text{R}^* \) is \( \text{NR}^1\text{R}^2 \), \( \text{R}^1 \) and \( \text{R}^2 \) optionally together with the nitrogen atom form an optionally substituted 5-12 membered ring, said ring optionally comprising 1 or more heteroatoms or a group selected from \( -\text{CO}-, -\text{SO}_2-, \) and \( -\text{SO}_3- \);

   \( \text{R}^{11} \) is selected from H or C₁₄ aliphatic; and

   \( \text{Y}^* \) is selected from the group consisting of fluoride, chloride, bromide, iodide, sulfate, nitrate, bicarbonate, carbonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate, alpha-ketoglutarate, alpha-glycerophosphate, methylsulfonylate, toluenesulfonate, and benzenesulfonate; or

   a pharmaceutically acceptable salt thereof.

2. A method of inhibiting cancer cell growth comprising contacting said cancer cell or in vivo with an effective amount of a compound of formula (I):

   \[
   \text{wherein: X}_1, \text{X}_2, \text{X}_3 \text{ are O; } \text{R}_5, \text{R}_6, \text{R}_7, \text{R}_8, \text{and R}_{10} \text{ are H, and R}_4 \text{ and } \text{R}_8 \text{ are methyl; and } \text{Z is } -\text{CH}_3\text{R}^* \text{ wherein R}^* \text{ is an amino acid residue bonded to the Z methylene via a nitrogen or a sulfur atom; or R}^* \text{ is } -\text{NR}_2\text{CO}_2-\text{R}^2, -\text{NR}_2\text{C(O)NR}_2, -\text{S}-\text{R}^1, -\text{NR}_2\text{R}^2, \text{or } -\text{N}^\text{Y}^*\text{R}^1\text{R}^2\text{R}^{11}\text{Y}^* \text{ wherein } \text{R}^1 \text{ and } \text{R}^2 \text{ are independently selected from H, CN, and optionally substituted straight-chained or branched aliphatic optionally containing 1 or more double or triple bonds; wherein optional substituents are selected from one or more of } -\text{NH}_2, -\text{NH}-(\text{C}_1\text{-aliphatic}), -\text{N}-(\text{C}_1\text{-aliphatic})_2, \text{halogen, } -\text{OH}, -\text{O}-(\text{C}_1\text{-aliphatic}), -\text{NO}_2, -\text{CN}, -\text{CO}_2\text{H}, -\text{CO}_2(\text{C}_1\text{-aliphatic}), -\text{O}(\text{halo C}_1\text{-aliphatic}), \text{or } -\text{halo(C}_1\text{-aliphatic)}; \text{wherein each C}_1\text{-aliphatic is optionally substituted; or } \text{R}^1 \text{ and } \text{R}^2 \text{ are independently selected from cycloalkyl, heterocycloalkyl, aryl or heteroaryl; and provided that } \text{R}^1 \text{ and } \text{R}^2 \text{ are not simultaneously H; or where } \text{R}^* \text{ is } \text{NR}^1\text{R}^2 \text{, R}^1 \text{ and } \text{R}^2 \text{ optionally together with the nitrogen atom form an optionally substituted 5-12 membered ring, said ring optionally comprising 1 or more heteroatoms or a group selected from } -\text{CO}-, -\text{SO}_2-, \) and \( -\text{SO}_3- \);
   \( \text{R}^{11} \) is selected from H or C₁₄ aliphatic; and

   \( \text{Y}^* \) is selected from the group consisting of fluoride, chloride, bromide, iodide, sulfate, nitrate, bicarbonate, carbonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate, alpha-ketoglutarate, alpha-glycerophosphate, methylsulfonylate, toluenesulfonate, and benzenesulfonate; or

   a pharmaceutically acceptable salt thereof.

3. The method of claim 1 wherein \( \text{Z} = -\text{CH}_2-\text{NR}^1\text{R}^2 \).

4. The method of claim 3 wherein \( \text{R}^1 \) and \( \text{R}^2 \) are independently selected from hydrogen, -CN or optionally substituted C₁₄ alkyl.

5. The method of claim 4 wherein \( \text{R}^1 \) and \( \text{R}^2 \) are independently selected from -\text{NO}_2, -\text{CN}, -\text{CH}_3, -\text{CF}_3, -\text{CH}_2\text{CH}_3, -\text{CH}_3\text{CF}_3, -\text{CH}_2\text{Cl}, -\text{CH}_2\text{OH}, -\text{CH}_2\text{CH}_2\text{OH} \) and -\text{CH}_2\text{NH}_2.

6. The method of claim 3 wherein \( \text{R}^1 \) and \( \text{R}^2 \) together with N form an optionally substituted ring.

7. The method of claim 6 wherein said ring is a monocyclic, bicyclic or tricyclic alkyl or aryl ring system, said ring system optionally substituted and optionally comprising one or more heteroatoms or a group selected from -\text{CO}-, -\text{SO}_2-, and -\text{SO}_3-.

8. The method of claim 7 wherein \( \text{R}^1 \) and \( \text{R}^2 \) are -\text{CH}_2(\text{CH}_2)_n\text{CH}_2\text{Y}-; where \( \text{Y} \) is a heteroatom or a group selected from -\text{CO}-, -\text{SO}_2-, and -\text{SO}_3; \text{n is an integer 0 to 5; and together with N form an optionally substituted ring, said ring optionally fased
to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, said system optionally substituted and optionally comprising one or more heteroatoms.

9. The method of claim 7 wherein R₁ and R₄ are

(CH₃)₂Y—(CH₂)₆—; where Y is a heteroatom or a group selected from —CO—, —SO—, and —SO₂--; a is an integer 0 to 5; b is an integer 0 to 5; the sum of a and b being 0 to 5; and together with N form an optionally substituted ring, said ring optionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, said system optionally substituted and optionally comprising one or more heteroatoms.

10. The method of claim 7 wherein NR₄ is selected from optionally substituted aziridin-1-yl, azetidin-1-yl, pyrrolidin-1-yl, piperidin-1-yl, homopiperidin-1-yl and heptamethyleneimino-1-yl.

11. The method of claim 1 wherein the compound of formula (I) is

11S,11,13-Dihydro, 13-dimethylamino-parthenolide; or

13. The method of claim 12 wherein the compound of formula (I) is

11S,11,13-Dihydro, 13-dimethylamino-parthenolide hydrochloride; or

14. The method of claim 1 wherein the compound of formula (I) is selected from:

11S,11,13-Dihydro, (pyrrolidin-1-yl)parthenolide hydrochloride;

11S,11,13-Dihydro, (piperidin-1-yl)parthenolide hydrochloride;

11S,11,13-Dihydro, (4-methylpiperidin-1-yl)parthenolide hydrochloride;

11S,11,13-Dihydro, 13-dimethylamino-parthenolide methiodide; or

15. The method of claim 1 wherein Z is —CH₂S—R³; wherein R³ is selected from optionally substituted straight-chain or branched aliphatic wherein optional substituents are selected from one or more of —NH₂, —N(C₆H₄ aliphatic)₂ halogen, —OH, —O—(C₆H₄ aliphatic), —NO₂, —CN, —CO₂H, —CO₂(C₆H₄ aliphatic), —O—halo C₆H₄ aliphatic, or —halo C₆H₄ aliphatic; wherein each C₆H₄ aliphatic is optionally substituted; cycloalkyl, heterocycloalkyl, aryl or heteroaryl.

16. The method of claim 2 wherein Z is —CH₃—NR₁R₂.

17. The method of claim 16 wherein R¹ and R² are independently selected from hydrogen, —CN or optionally substituted C₁-C₆ alky.

18. The method of claim 17 wherein R¹ and R² are independently selected from —NO₂, —CN, —CH₃, —CF₃, —CH₂CF₃, —CH₂Cl, —CH₂OH, —CH₂CH₂OH and —CH₂NH₂.

19. The method of claim 17 wherein R¹ and R² together with N form an optionally substituted ring.

20. The method of claim 19 wherein said ring is a monocyclic, bicyclic or tricyclic alkyl or aryl ring system, said ring system optionally substituted and optionally comprising one or more heteroatoms or a group selected from —CO—, —SO—, and —SO₂—.

21. The method of claim 20 wherein R¹ and R² are

—CH₃(CH₂)nCH₃Y--; where Y is a heteroatom or a group selected from —CO—, —SO—, and

—SO₂--; n is an integer 0 to 5; and together with N form an optionally substituted ring, said ring optionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, said ring system optionally substituted and optionally comprising one or more heteroatoms.

22. The method of claim 20 wherein R₁ and R₄ are

—(CH₂)nY—(CH₂)m--; where Y is a heteroatom or a group selected from —CO—, —SO—, and —SO₂--; a is an integer 0 to 5; b is an integer 0 to 5; the sum of a and b being 0 to 5; and together with N form an optionally substituted ring, said ring optionally fused to a cycloalkyl or aryl group to form a bicyclic or tricyclic ring system, said ring system optionally substituted and optionally comprising one or more heteroatoms.

23. The method of claim 20 wherein NR₄ is selected from optionally substituted aziridin-1-yl, azetidin-1-yl, pyrrolidin-1-yl, piperidin-1-yl, homopiperidin-1-yl and heptamethyleneimino-1-yl.

24. The method of claim 2 wherein the compound of formula (I) is selected from:
11S,11,13-Dihydro, 13-dimethylaminoparthenolide;
11S,11,13-Dihydro, 13-diethylaminoparthenolide;
11S,11,13-Dihydro, 13-(tert-butylamino)parthenolide;
11S,11,13-Dihydro, 13-(pyrrolidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(piperidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(morpholin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(4-methylpiperazin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(4-methylpiperazin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(homopiperazin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(heptamethylenecinim-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(azetidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-methylbutyl aminoparthenolide;
11S,11,13-Dihydro, 13-methyl pentyl aminoparthenolide;
11S,11,13-Dihydro, 13-ethylaminoparthenolide;
11S,11,13-Dihydro, 13-methylaminoparthenolide;
11S,11,13-Dihydro, 13-cyclopropylaminoparthenolide;
11S,11,13-Dihydro, 13-propargylaminoparthenolide;
11S,11,13-Dihydro, 13-(N-benzyl-N-ethylamine)parthenolide;
11S,11,13-Dihydro, 13-(N-prolyl)parthenolide;
11S,11,13-Dihydro, 13-(S-thiophenyl)parthenolide;
11S,11,13-Dihydro, 13-(N,N-diethanolamine)parthenolide;
11S,11,13-Dihydro, 13-(thiomorpholin-4-yl)parthenolide;
11S,11,13-Dihydro, 13-(4-hydroxy piperidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(1-methyl homopiperazin-4-yl)parthenolide;
11S,11,13-Dihydro, 13-(S-mercaptoacetetyl)parthenolide;
11S,11,13-Dihydro, 13-(4-(2-hydroxyethyl)piperidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(piperazin-1-yl-4-carboxaldehyde)parthenolide;
11S,11,13-Dihydro, 13-(4-benzyl piperidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-(piperidin-1-yl-4-carboxylic acid)parthenolide;
11S,11,13-Dihydro, 13-(azetidin-1-yl-3-carboxylic acid)parthenolide;
11S,11,13-Dihydro, 13-(S-cysteiny1)parthenolide;
11S,11,13-Dihydro, 13-(4-piperidin-1-yl)piperidin-1-yl)parthenolide;
11S,11,13-Dihydro, 13-diallylaminoparthenolide; or
a pharmaceutically acceptable salt thereof.

25. The method of claim 24 wherein the compound of
formula (I) is
11S,11,13-Dihydro, 13-dimethylaminoparthenolide; or
a pharmaceutically acceptable salt thereof.

26. The method of claim 25 wherein the compound of
formula (I) is
11S,11,13-Dihydro, 13-dimethylaminoparthenolide
hydrochloride; or
11S,11,13-Dihydro, 13-dimethylaminoparthenolide
maleate.

27. The method of claim 2 wherein the compound of
formula (I) is selected from:
11S,11,13-Dihydro, 13-(pyrrolidin-1-yl)parthenolide
hydrochloride;
11S,11,13-Dihydro, 13-(piperidin-1-yl)parthenolide
hydrochloride;
11S,11,13-Dihydro, 13-(4-methyl piperidin-1-yl)parthenolide
hydrochloride;
11S,11,13-Dihydro, 13-dimethylaminoparthenolide
methiodide; or
11S,11,13-Dihydro, 13-(4-methyl piperidin-1-yl)parthenolide
methiodide.

28. The method of claim 2 wherein Z is —CH₂S—R¹;
wherein
R¹ is selected from optionally substituted straight-chained
or branched aliphatic wherein optional substituents are
selected from one or more of —NH₂, —N(C₄₋₄ aliphatic)₂,
ahalogen, —OH, —O—(C₄₋₄ aliphatic),
—NO₂, —CN, —CO₂H₁₋₄, —CO₂(C₄₋₄ aliphatic), —O—
(halo C₁₋₄ aliphatic), or (halo C₁₋₄ aliphatic); wherein
each C₁₋₄ aliphatic is optionally substituted; cycloalkyl,
heterocycloalkyl, aryl or heteroaryl.

29. The method of claim 2 wherein Z is —CH₂S—R¹;
wherein
R¹ is selected from optionally substituted straight-chained
or branched aliphatic wherein optional substituents are
selected from one or more of —NH₂, —N(C₄₋₄ aliphatic)₂,
ahalogen, —OH, —O—(C₄₋₄ aliphatic),
—NO₂, —CN, —CO₂H₁₋₄, —CO₂(C₄₋₄ aliphatic), —O—
(halo C₁₋₄ aliphatic), or (halo C₁₋₄ aliphatic); wherein
each C₁₋₄ aliphatic is optionally substituted; cycloalkyl,
heterocycloalkyl, aryl or heteroaryl.
It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

In the Claims:

In Claim 1, please insert at column 33, line 43:

-- N(C\textsubscript{1-4} -- before "aliphatic\textsubscript{2}"
