This Report is brought to you for free and open access by the Plant and Soil Sciences at UKnowledge. It has been accepted for inclusion in Agronomy Notes by an authorized administrator of UKnowledge. For more information, please contact UKnowledge@lsvaky.edu.
The number of soil samples tested in soil testing laboratories under the supervision of the College of Agriculture in 1964 showed an increase of 6,028 samples. In 1963, 46,444 samples were tested compared to 52,472 in 1964. These figures do not include the thousands of samples tested in commercial laboratories.

A summary of the 1964 soil test results has been prepared and is available for distribution. This summary shows the number of samples tested in each county along with the percentage testing in the various categories for acidity, available phosphorus and available potassium.

It should be pointed out that samples from fields that have been in tobacco usually test high in available phosphorus and potassium and may be more acid than samples obtained from fields that have been in other crops. Another factor that must be considered is that samples are not obtained from all farms in the county. Even though these limitations exist, this summary is the best guide available as to the lime and fertilizer needs in each county.

Should you desire a copy of the 1964 soil test summary send a card or letter to George Corder or Harold Miller, Agronomy Department, University of Kentucky, Lexington, indicating the number of copies you desire.
